Thus both nations lived in the greateſt friendſhip, doing mutual good offices for each other, till ſome of the *Engliſh* in *Virginia*, envying the happineſs of this thriving colony, had the baſeneſs to ſuggeſt to the *Indians*, that theſe ſtrangers were not really *Engliſh*, as they pretended, but *Spaniards*, and would enſlave them, as they had done many of their countrymen. Thus they ſowed the ſeeds of ſuſpicion and enmity in the minds of theſe ſuſceptible people, who reſolved upon attacking the new ſettlers; but they gaining timely intelligence of the deſign, prepared to defend themſelves, built a ſtrong fort with great expedition, and took every other proper precaution for their defence; but ſtill continued to treat the *Indians* with great kindneſs, which, co-operating with the dread of their arms, fruſtrated the ill deſigns of their enemies.

Being thus happy in the enjoyment of peace and plenty, they ſoon received reinforcements from *England*, many popiſh families of rank and fortune retiring thither to avoid the penal laws which were at that time made againſt them in *England*. After the king's death, *Cromwell* deprived the proprietor of his rights, and *Maryland* remained under the governors appointed by the parliament and *Cromwell* till the Reſtoration, when lord *Baltimore* was reinſtated in his former poſſeſſions, which he cultivated with his uſual wiſdom, care, and moderation. No people could live in greater eaſe and ſecurity; and his lordſhip, willing that as many as poſſible ſhould enjoy the benefits of his mild and equitable adminiſtration, gave his conſent to an act of aſſembly, which he had before promoted in this province, for allowing a free and unlimited toleration for all who profeſſed the Chriſtian religion, of whatever denomination. This liberty, which was never violated, encouraged a great number, not only of the church of *England*, but of all kinds of diſſenters, to ſettle in *Maryland*, which before that time was almoſt wholly in the hands of Roman Catholics.

Though this nobleman was guilty of no mal-adminiſtration in his government, though he was a zealous Roman Catholic, and firmly attached to the cauſe of *James* II. this could not prevent his charter being queſtioned in that arbitrary reign, and a ſuit being commenced to deprive him of the property and juriſdiction of a province granted by the royal favour, and peopled by himſelf at a vaſt expence: but it was the error of that weak prince, neither to know his friends nor his enemies. Upon the Revolution, lord *Baltimore* had no reaſon to expect any favour, yet he met with more than the abdicated prince himſelf had intended him: he was indeed deprived of his juriſdiction, but was allowed the profits of his province, which were very conſiderable; and when his deſcendants conformed to the church of *England*, they were reſtored to all their rights.

SECT. III.

The Southern American *States.*

VIRGINIA.

THE preſent boundaries of this ſtate have been very accurately and minutely delineated by *Mr. Jefferſon*. The *Atlantic* on the E.; on the N. an imaginary line, extending along 37°. 57'. N. from near the mouth of the *Potowmac*, along that river, which divides it from *Maryland*, to 39°. 43'. N. and from thence weſtward to the *Ohio*; along the banks of that river, until it forms a junction with the *Miſſiſſippi*, about the latitude of 36°. 30'. and in 89°. of W. longitude; comprehending a vaſt extent of uncultivated land; on the S. by a line of latitude in that parallel, running eaſtward to the *Atlantic*, through an extent of 758 miles; ſuch being the diſtance of that immenſe river from that ocean, when its courſe tends neareſt to it. The extent of this ſtate from N. to S. is 223 miles. *Mr. Jefferſon* repreſents it as one third larger than the iſlands of *Great Britain* and *Ireland*; but the greateſt part of this extent lies to the weſtward of the *Alleghany* mountains, and no attempts have as yet been made to ſettle it. The ſtate has ceded to Congreſs all the lands which it poſſeſſed, by virtue of charters and grants, on the N. ſide of the *Ohio*.

Mr. Jefferſon aſſerts that a change in the climate of *Virginia* is taking place very ſenſibly, and both heats and colds have become much more moderate within the memory even of the middle-aged. Snows are now leſs frequent and leſs deep; and elderly people relate that the earth uſed to be covered with ſnow about three months in every year; the rivers which then ſeldom failed to freeze over in the courſe of the winter, ſcarcely ever do ſo now. This change, he adds, has produced an unfortunate fluctuation between heat and cold, which is very fatal to fruits. By a great number of obſervations made on the winds at *Williamſburgh*, and at *Monticello*, (one of the moſt eaſtern ridges of mountains called the South Weſt, where they are interſected by the *Rivanna*,) and reducing them to four principal points, namely, N.E. S.E. S.W. and N.W. which points are perpendicular to, or parallel with the coaſt, mountains, and rivers of *Virginia*, it appeared that the S.W. wind prevailed equally in both places; that the N.E. is, next to this, the principal wind toward the ſea-coaſt; and the N.W. is the predominant wind at the mountains. The difference between theſe two winds is very great: the N.E. is loaded with vapour; it brings a diſtreſſing chill; is heavy and oppreſſive to the ſpirits; the N.W. is dry, cooling, elaſtic, and animating; the eaſtern and ſouth eaſtern breezes come on generally in the afternoon; they have advanced into the country very ſenſibly, within the memory of people now living; they formerly did not penetrate far above *Williamſburgh*, but are now frequent at *Richmond*, and ſometimes reach the mountains; as the lands become more cleared, it is probable they will extend ſtill farther weſtward. *Jefferſon's Notes on Virginia*, p. 127.

The ſame accurate obſerver and elegant writer takes notice of a phænomenon which *Capt. Cook* had occaſion to notice in his ſecond voyage. "Going out into the open air," ſays he, "in the temperate and warm months of the year, we often met with bodies of warm air, which, paſſing by us in two or three ſeconds, do not afford time for the beſt thermometer to ſeize their temperature. They are ſuppoſed to approach the ordinary heat of the human body, ſome may exceed it a little; they are about twenty or thirty feet diameter, horizontally; of their height we have no experience; but probably they are globular volumes wafted or rolled along with the wind. They do not come in the winter; when they are felt the air is always dry, and temperately warm, with a moderate current of wind. They are moſt frequent about ſun-ſet, rare in the middle parts of the day, and never met with in a morning." *Idem*, p. 128.

In the ſummer ſeaſon there are frequent and violent guſts, with thunder and lightning; and it is not uncommon to ſee in the woods trees torn and riven to pieces by the force of the lightning; but as moſt houſes have electrical rods, or conductors, affixed to them, the fatal conſequences which were formerly experienced, are in general averted. "I believe," ſays Mr. *Burnaby*, "no country has more certainly proved the efficacy of electrical rods than this: before the diſcovery of them, theſe guſts were frequently productive of melancholy conſequences, but now ſuch inſtances are very rare, and no houſe was ever known to be ſtruck where thoſe rods were fixed: yet it has frequently happened that the rods themſelves have been melted, or broken to pieces, and the houſes ſcorched along the ſide of them, yet never has any misfortune happened." *Travels*, p. 10.

Spring here is ſomewhat earlier than with us: in April they have frequent rains; May and June are very pleaſant months, the heat being greatly tempered by cooling breezes; but the changes from heat to cold, and from cold to heat, are then peculiarly ſudden and violent; July and Auguſt are generally very ſultry, the air ſometimes becoming in a manner ſtagnant, which produces dreadful thunder and lightning; but even then, the heat is rendered tolerable by the refreſhing ſea-breezes; and in September and October the rains fall, when the inhabitants become liable to agues and intermitting fevers. Their winter froſts come on without the leaſt warning; thus, after a warm day, toward the ſetting in of winter, ſo intenſe a cold often ſucceeds, as to freeze the rivers in one night; but theſe froſts, as well as their rains, are rather violent than of long continuance.

The whole face of the country is ſo extremely low toward the ſea, that, within fifteen fathom ſoundings, land can ſcarcely be diſtinguiſhed from the maſt-head. The bay of *Cheſapeak* is one of the largeſt and ſafeſt bays perhaps in the world; for it enters the country near three hundred miles from the S. to the N. having the eaſtern ſide of *Maryland*, and a ſmall part of *Virginia* on the ſame peninſula, to cover it from the *Atlantic* ocean. This bay is almoſt eighteen miles broad for a conſiderable way, and ſeven where it is narroweſt, the water in moſt places being nine fathom deep. Through its whole extent it receives, both on the eaſtern and weſtern ſide, a vaſt number of fine navigable rivers; for, beſide thoſe of *Maryland*, it receives from the ſide of *Virginia*, *James-river*, *York-river*, the *Rappahanock*, and the *Potowmac*.

Theſe rivers are not only navigable themſelves for very large veſſels a prodigious way into the country, but have ſo many creeks, and receive ſuch a number of ſmaller navigable rivers, as render the communication of all parts of this country inconceiveably more eaſy than that of any other. The *Potowmac* is navigable for near two hundred miles; it is nine miles broad at its mouth, and for a vaſt way not leſs than ſeven. The other three are navigable upward of eighty; and in the windings of their ſeveral courſes approach one another ſo nearly, that the diſtance between them is in ſome parts not more than ten, and ſometimes not above five miles; while in others there is fifty miles between each of theſe rivers. The planters, as in *Maryland*, load and unload veſſels of great burden at their own doors; which, as their commodities are of ſmall value in proportion to their bulk, is a very neceſſary accommodation.

Over a ſtream of water called *Cedar Creek*, which runs into *James'* river, in the county of *Rockbridge*, is a natural bridge, which *Mr. Jefferſon* ſtyles 'the moſt ſublime of Nature's works." It is on the aſcent of a hill, which ſeems to have been cloven through its length by ſome great convulſion. The fiſſure juſt at the bridge, is, by ſome admeaſurements, 270 feet deep, by other only 205. It is about 45 feet wide at the bottom, and 90 feet at the top. Its breadth in the middle is about 60 feet, but more at the ends; and the thickneſs of the maſs at the ſummit of the arch about 40 feet. A part of this thickneſs is conſtituted by a coat of earth, which gives growth to many large trees. The reſidue, with the hills on both ſides, is one ſolid rock of limeſtone. The arch approaches the ſemi-eliptical form; but the larger axis of the ellipſis, which would be the chord of the arch, is many times longer than the tranſverſe. Though the ſides of this bridge are provided, in ſome parts, with a parapet of fixed rocks, yet few men have reſolution to walk to them and look over into the abyſs. But if the view from the top be painful and intolerable, that from below is delightful in an equal extreme. It is impoſſible for the emotions ariſing from the ſublime to be felt beyond what they are here: ſo beautiful an arch! ſo elevated! ſo light! &c. ſpringing, as it were, up to heaven! fills the ſpectator with indeſcribable rapture. The fiſſure continuing narrow, deep, and ſtraight, for a conſiderable diſtance above and below the bridge, opens a ſhort, but very pleaſing view of the north mountain on one ſide, and *Blue* ridge on the other, each at the diſtance of about five miles. *Jefferſon's Notes on Virginia*, p. 36.

The ſoil in the low grounds of *Virginia* is a dark fat mould, which for many years, without any manure, yields a plentiful increaſe of whatever is committed to it. The land higher up the rivers, throughout the whole country, is in general level, with ſhallow vallies, which abound with ſprings and ſtreams of clear water, interſperſed with ſmall hills and extenſive vales. The lands next the rivers are ſtored with *oaks*, *walnut-trees*, *hickeries*, *aſh*, *beech*, *poplar*, and many other ſorts of timber of a ſurpriſing ſize. The heads of the rivers afford a mixture of hills, vallies, and plains, adorned with fruit and timber trees.

There are alſo found great variety of earths, as *antimony*, *talck*, *yellow* and *red ochre*, *fullers' earth*, and *tobacco-pipe clay*.

Near the ſouthern boundary of *Virginia* are mines of *lead*. A *copper mine* was once opened in the county of *Amhurſt*, on the N. ſide of *James'* river, and another in the oppoſite county on the S. ſide; but they yielded little, and the working them is diſcontinued. On the S. ſide of the ſame river are three mines of *iron*, which are worked, and one on the N. ſide; in *Auguſta* county one, and in *Frederick's* another: there is another forge at *Frederickſburgh*, which makes bar iron from pigs imported from *Maryland*; another on *Neapſco* of *Potowmac*. The indications of iron are numerous throughout all the middle country. Conſiderable quantities of *black lead* are taken from *Winterham*, in the county of *Amelia*. The country on *James'* river, from fifteen to twenty miles above *Richmond*, and for ſeveral miles northward and ſouthward, is replete with coal of a very excellent quality; and in the weſtern country it is abundant. There is very good marble, and in great abundance, near *James'* river. In the neighbourhood of the mountains are quarries of ſtone fit for the chiſſel, white, blue, brown, &c. with good *mill-ſtone* and *ſlate*. *Iſinglaſs*, or *nicea*, is in ſeveral places; *loadſtone* alſo, and an *aſbeſtos* of a ligneous texture, are ſometimes to be met with. *Marle* abounds generally, and a clay of which bricks are made; *chalk* and *ochres*. The country weſtward of the *Alleghany* mountains abounds with ſprings of common ſalt. There are ſeveral medicinal ſprings, the moſt efficacious of which are two ſprings in *Auguſta* county, near the firſt ſource of *James'* river, about ſix miles diſtant from each other.

There is no better wheat than that produced in this province and in *Maryland*; the quantity grown on the eſtate of general *Waſhington*, about *Mount Vernon*, is prodigious; the greateſt part of which, in the year 1789, was ſent to the ports of the *Mediterranean*. It alſo produces other ſorts of *Engliſh* grain, as *barley*, *oats*, *rye*, *peas*, &c. but the cultivation of *tobacco* has, until lately, been the chief object.

This plant, at its full height, is as tall as a common-ſized man; the ſtalk is ſtraight, hairy, and clammy; the leaves alternately of a faded yellowiſh green, and toward the lower part of the plant of a great ſize. The tobacco ſeeds are firſt ſown in beds, where, having remained a month, the young ſprouts are in the firſt rainy weather tranſplanted, and the earth raiſed about them: within the ſpace of another month they grow near a foot high; after which the people top them and prune off the bottom leaves, leaving only ſeven or eight on the ſtalk, that they may be the better fed; after which theſe leaves in ſix weeks time come to their full growth. The planters prune off the ſuckers, and clear them of the hornworm twice a week, which is called worming and ſuckering. This laſt work laſts three weeks or a month, by which time the leaf, from being green, begins to turn browniſh, and to ſpot and thicken, which is the ſign of its ripening. They cut the plants down as faſt as they ripen, heap them up, and let them lie a night to ſweat. The next day they carry them to the tobacco-houſe, where every plant is hung up at a convenient diſtance from each other, for about a month or ſix weeks; they take them down in moiſt weather, elſe they would crumble to duſt. After this they are laid upon ſticks, and covered up cloſe in the tobacco-houſe for a week or a fortnight to ſweat; and then opening the bulk in a wet day, they are ſtripped and ſorted, the top leaves being the beſt, and the bottom the worſt tobacco. The laſt work is to pack it in hogſheads, or to bundle it up, which is alſo done in a wet ſeaſon; for in the curing of tobacco wet ſeaſons are as neceſſary as dry to render the leaf pliant.

This plant was firſt introduced into *England* by *Sir Walter Raleigh*. *James* I. iſſued a proclamation prohibiting the uſe of it, "as deſtructive to the health of the lower claſs of people, weakening their bodies and rendering them unfit for labour." Little was it then apprehended that *England*, in after times, would employ upward of two hundred ſail of ſhips in conveying that plant to *Europe*, and that the duties upon it would form a very conſiderable branch of the public revenue! In the year 1758 *Virginia* exported 70,000 hogſheads of tobacco, which was the greateſt quantity ever produced in the country in one year; but its culture was faſt declining at the commencement of the late war, and that of wheat taking place. It has continued to decline ſince the peace. "I ſuſpect," ſays *Mr. Jefferſon*, 'that the change in the temperature of the climate has become ſenſible to that plant, which to be good requires a conſiderable degree of heat; but it requires ſtill more indiſpenſably an uncommon fertility of ſoil; and the price which it commands at market will not enable the planter to produce this by manure. It is a culture productive of infinite wretchedneſs. Thoſe employed in it are in a continual ſtate of exertion beyond the powers of nature to ſupport. Little food of any kind is raiſed by them; ſo that the men and animals on theſe farms are badly fed; and the earth is rapidly impoveriſhed. The cultivation of wheat is the reverſe in every reſpect: beſide cloathing the earth with herbage and preſerving its fertility, it feeds the labourer plentifully, requires from him only a moderate toil, except in the ſeaſon of harveſt, raiſes great numbers of animals for food and ſervice, and diffuſes plenty and happineſs among the whole. We find it eaſier to make one hundred buſhels of wheat than a thouſand weight of tobacco, and they are worth more when made." *Notes on Virginia*, p. 278.

The climate ſuits *rice* well enough wherever the land does. *Hemp*, *flax*, and *cotton*, are ſtaple commodities.

The country is every where overſpread with a vaſt variety of curious plants and flowers. They have a ſort of *briar*, growing ſomewhat like the ſarſaparilla, the berry of which is as large as a pea, and of a bright crimſon colour, very hard and finely poliſhed. The flowers grow ſpontaneouſly in a great variety: among theſe is a moſt beautiful crown imperial; the *cardinal flower*, which is of a beautiful ſcarlet; the *moccaſin flower*, and many others; for almoſt all the year round, the levels and vales are beautified with flowers of one colour or other, which render the woods as fragrant as a garden. From theſe materials the wild bees make vaſt quantities of honey; but their magazines are often rifled by bears, racoons, and the like. The bees of *North America* perfectly reſemble thoſe of *Europe*: they have generally extended themſelves into the country a little in advance of the white ſettlers; the *Indians* therefore call them 'the white man's fly,' and conſider their approach as indicating the approach of the ſettlements of the whites. There is alſo found the fine tulip-bearing *laurel-tree*, which has the pleaſanteſt ſmell in the world, and keeps bloſſoming and ſeeding ſeveral months together: it delights much in the gavelly banks of the brooks, and perfumes the very woods with its odour; as does alſo the large *tulip-tree*; the *locuſt*, which reſembles the jeſſamine; and the perfuming *crab-tree*.

At the mouth of the rivers, along the banks of the ſea and bay, and likewiſe near many of the creeks and ſwamps, grows the *myrtle*, which bears a berry of which the inhabitants make a hard brittle wax of a beautiful green colour, which by refining becomes almoſt tranſparent. Of this they make candles, which are never greaſy to the touch, nor melt with lying in the hotteſt weather; nor does the ſnuff ever offend the ſmell, like that of a tallow-candle; but inſtead of being diſagreeable, if a candle be put out, it yields a pleaſant fragrance, which is diffuſed all over the room. *Cedar-berries* have been found to yield the ſame ſort of wax; but their berries are as much larger than pepper, as thoſe of the myrtle are leſs.

The fruits natural to the country are in great abundance.

Peaches, *nectarines*, and *apricots*, grow upon ſtandard trees, and thrive here extremely; and of the two firſt there are finer ſorts than in *England*. The beſt ſort of theſe cling to the ſtone, and will not come off clear; they are called *plum-nectarines* and *plum-peaches*. Some of theſe are twelve or thirteen inches in compaſs. Theſe ſorts of fruits are raiſed ſo eaſily there, that ſome good huſbandmen, who live at a diſtance from the woods, plant large orchards of them purpoſely for their hogs; and others make a drink of them, which they call *mobby*, and either drink it like cyder, or make brandy of it by diſtillation, it making the next beſt ſpirit to grapes.

Of the *cherries* which grow wild in the woods there are at leaſt three ſorts, two of which grow upon trees as large as the common *Engliſh* oak; the fruit of one of them grows in bunches like grapes. Both theſe ſorts are black without, and but one of them red within: this laſt is more palatable than the *Engliſh* black cherry, it not having its bitterneſs. The other, which hangs on the branches like grapes, is water-coloured within, of a faintiſh ſweet, and is greedily devoured by the ſmall birds. The third ſort, which is called the *Indian* cherry, grows higher up the country, and is commonly found by the ſides of rivers growing on ſmall ſlender trees that are ſcarce able to ſupport them; but this is the moſt delicious cherry in the world; it is of a dark purple when ripe, and grows upon a ſingle ſtalk like the *Engliſh* cherry; but is very ſmall. They are, however, ſo greedily devoured by the ſmall birds, that they ſeldom remain long enough on the tree to ripen. This ſeems to be the ſand cherry deſcribed in p. 657, col. 2.

An incredible variety and plenty of *grapes* grow wild, ſome of which are very ſweet and pleaſant to the taſte, and others very harſh and rough.

The *honey* and *ſugar-trees* grow near the heads of rivers. The firſt bears a thick ſwelling pod full of honey, appearing at a diſtance like the bending pod of a bean or pea. The other yields a kind of ſap, or juice, which by boiling is made into ſugar. The juice is drawn off by making an inciſion in the trunk of the tree, and placing a receiver under it. The *Indians* make one pound of ſugar out of eight pounds of the liquor. This ſugar has a large full grain, and its ſweetneſs reſembles that of good muſcovado.

They have *muſk-melons*, *water-melons*, *pompions*, *cuſhaws*, *macoas*, and *gourds*.

There are here a great variety of berries, all very good in their kind. They have three ſorts of *mulberries*, two black and one white.

Two ſorts of *currants* grow ſpontaneouſly, one red the other black; but theſe are far more pleaſant than thoſe of the ſame colours in *England*.

The *wild ſtrawberries* are here as delicious as any in the world, and grow almoſt every where in the woods and fields; alſo wild *raſpberries*, *cranberries*, and *hurtleberries*, with various kinds of *nuts*. Beſide theſe, they have all the other fruits common in *England*.

A kitchen-garden thrives no where better or faſter; they have all the culinary plants that grow in *England*, in far greater perfection, with many others that will not grow there. Beſide theſe they have many medicinal plants, roots, and wood fit for medicine and dying. The *ſnake-root* here is a great antidote in all peſtilential diſtempers; the *rattle-ſnake-root* is the moſt admirable remedy ever diſcovered for curing the bite of that reptile, which has ſometimes been mortal in two minutes. If this medicine be early applied it preſently removes the infection, and in two or three hours reſtores the patient to as perfect health as if he had never been hurt.

The virtues of this plant were diſcovered by a negro in *Virginia*, by which diſcovery he not only ſaved his life, but obtained his liberty and a penſion. Like many other diſcoveries, it was the mere effect of chance. The poor fellow having been bitten in the leg by a rattle-ſnake, lay down on the graſs in great agony, and happened to gather ſome of this plant, which he chewed, and applied to the wound, ſuppoſing it might cool and allay the inflammation. He found it give him inſtant relief, and therefore renewed the application ſucceſſively, by which he found the ſwelling abate, and he was able to walk home. He continued to uſe the application for two or three days, in which time he was perfectly recovered. *Travels into the interior Parts of North-America*, I. 388.

The plants and roots found in *Virginia* when it was firſt viſited by the *Engliſh*, were tobacco, maize, potatoes, pompkins, cumlins, and ſquaſhes. Dr. *Clayton*, a ſkilful botaniſt, a native of *Virginia*, and who reſided there, has given a copious and ſcientific account of the plants and flowers of that ſtate, in a work which he entitled *Flora Virginica*, publiſhed at *Leyden* in the year 1762.

The *James'* town *weed* or *plant* is ſaid to have very wonderful properties: its leaves, when eaten, produce a temporary impotence; for ſuch was their effect upon a ſhip's crew that arrived at *James'* town. A phyſician informed Mr. *Thomſon*, ſecretary of Congreſs, that a patient of his, a girl, had put the ſeeds of this plant into her eye, which dilated the pupil to ſuch a degree, that ſhe could ſee in the dark, but in the light was almoſt blind. *Jefferſon's Notes*, p. 337.

The *ginſang-root* is a native of *North America*, but is ſomewhat inferior to that raiſed at *Korea* in *Aſia*. Its root is like that of a ſmall carrot, but not ſo taper at the end; it is ſometimes divided into two or more branches; in all other reſpects it reſembles *ſarſaparilla* in its growth. The *Chineſe* are the chief conſumers of this root. There is a heavy duty on its importation into *China*, which cauſes it to be clandeſtinely conveyed into the kingdom in great quantities.

The *hemlock-tree* grows in every part of *America*; it is an ever-green of a very large growth, and has leaves ſomewhat like that of the yew. It is, however, quite uſeleſs, and only an incumbrance to the ground; the wood being of a very coarſe grain, and full of wind ſhakes or cracks. *Carver's Travels*, p. 498.

ANIMALS, BIRDS, SNAKES, &c.

It has been already obſerved, that there were neither horſes, cows, ſheep, nor hogs, in *America*, before they were carried thither by the *Europeans*; but now they are multiplied ſo extremely, that many of them here run wild. The hogs in particular are very numerous, and in general find their own ſupport in the woods, without any care of their owner; and it is well if the proprietor can find and catch the pigs, or any part of a farrow, when they are young, in order to mark them; for if there be any marked in the herd, they determine the property of the reſt, becauſe they ſeldom miſs their gangs.

There are alſo many horſes foaled in the woods of the uplands, which become wild. The young men take great delight in hunting theſe wild horſes, which they purſue ſometimes with dogs, and ſometimes without; for as they have no mark upon them, they belong to the firſt who takes them; but they are ſo ſwift, that it is very difficult to come up with them.

Among the animals originally found in *Virginia* are *panthers*, *bears*, *wolves*, *elks*, *red* and *fallow-deer*, *racoons*, *wild-cats*, the *opoſſum*, &c.

The *panther* of *North America* is of the cat kind, near as large as the tyger, and much of the ſame ſhape. It is of a pale reddiſh colour, finely mottled with ſmall round black ſpots, and the hair is ſhort. The eyes of theſe animals are large and of a greyiſh colour, very fierce and ſparkling. Their tails are exceeding long; and they are very ſtrong limbed. They pur like a cat, and will climb trees with the greateſt agility imaginable; but are ſo wild, that they cannot be tamed even when taken young. They devour ſwine, deer, or any other creature they can maſter; but ſeldom attack mankind, except they are enraged by being wounded: it is even ſaid that a ſmall dog will make them take to a tree, where they generally remain till they are ſhot by the huntſmen. The fleſh is much admired.

The *bears* are not very large; and though their form is unwieldy, yet they climb trees nimbly, and in coming down always go with the tail foremoſt. They are alſo very dexterous and expert in fiſhing. It has been remarked, that the female never appears abroad when with young. Bear-hunting is a common diverſion both with the *Chriſtians* and *Indians*, the former having a breed of dogs fit for that ſport. Their fleſh is good, nouriſhing, and not inferior in taſte to the fineſt pork; the paws are accounted the beſt eating. The young cubs are a moſt delicious diſh; the planters prefer the fleſh to that of any other meat.

The *elk* is a ſtrong and ſwift beaſt, larger than a horſe, and exactly like a deer. It has two large horns, which weigh twelve or fourteen pounds. Its neck is ſhort and thick, but the ears and back are very long. In colour it reſembles a hart; but its fleſh is not near ſo ſweet as that of the fallow-deer.

The *racoon* is of a dark grey colour, and in ſhape and ſize partly reſembles a fox; but has large black eyes, with great whiſkers like a cat; the noſe reſembles that of a pig, and the feet are formed like thoſe of a monkey. The tail is round, and encircled with annular ſtripes like that of a cat. It makes uſe of its fore-feet in the manner of hands, and will run up a tree to the very end of the boughs. This animal is very fond of crabs, and it is ſaid that when he would catch them, he ſtands by the ſide of the water and lets his tail hang in, which the crab faſtening his claws in, the racoon ſprings forward a conſiderable way upon the land, dragging the crab along with him, which no ſooner finds itſelf out of its element than it lets go its hold, and the racoon ſeizing it croſſwiſe in his mouth, devours it.

The *opoſſum* is a very extraordinary animal of the ſize of a cat, it being almoſt eighteen inches in length; the head reſembles that of a fox; the eyes are little, round, clear, and lively; and the ears long, broad, ſmooth, thin, tranſparent, and placed erect. The fore-legs are ſhort, and no more than three inches long; but thoſe behind are more than four, and the feet reſemble hands. Its back is covered with long hair; but on the head, neck, under the belly, and legs, it is pretty ſhort. The tail is round, and a foot long, with which it lays hold of the branches of trees, and thus ſuſpends itſelf. It is hairy from the root to the length of four inches; but the other part is naked, and ſcaled like a ſnake, which it nearly reſembles. The whole back, the ſides, and the upper part of the tail, are chiefly black; but under the neck, belly, and tail, it is of a yellowiſh colour. This animal has one peculiar property which diſtinguiſhes it from all others in the world, the female having a falſe belly, or bag, hanging below under the other belly, with a pretty large aperture at the end, toward the hinder-legs. Within this bag, on the uſual parts of the common belly, are eight teats, and, what is very extraordinary, upon theſe, when the female conceives, the young are formed, and there hang like fruit upon the ſtalk, with all their members complete, till they grow in bulk and weight to their appointed ſize; and then dropping off, are received in the falſe belly, from whence they go out at pleaſure, and in which they take refuge when any danger threatens. The falſe belly is hairy within, and the aperture, which is big enough to hold a large orange, ſhuts up pretty cloſe, and cannot be well opened without violence. Improbable as this method of propagation may appear, yet this account is confirmed by a conſiderable number of authors, and particularly by that great naturaliſt Mr. *Ray*, who diſſected one of theſe animals himſelf, and informs us, that this falſe belly is the only uterus the animal has, no other being to be found.

There are here four or five different ſpecies of ſquirrels, one generally larger than a rabbit, yet good to eat. It is commonly of a grey colour, yet ſome are pied, and ſome white, red, and black.

The *flying-ſquirrel* is of a grey or light dun colour, and is leſs than the *Engliſh*. It has a fine thin ſkin on each ſide, covered with hair like the reſt of the body, and extending from the fore-feet to the hinder-feet, which buoys them up as they ſpring from one tree to another, and enables them to take a much more extenſive leap than any other ſquirrel; this is termed flying.

The *rabits* here differ from thoſe of *Europe*: they do not burrow, but take refuge in hollow trees; which they climb like cats, and often to a very great height.

The *Marquis de Chaſtellux* ſhot an animal which proved to be the *mamax*, or *marmoſet*, of *America*. In its form, fur, and colour, it reſembled very much the muſk-rat, but it was larger, and differed eſſentially in the tail, which was ſhort and rough. Like the muſk-rat its ribs were ſo ſhort and flexible that they might be miſtaken for griſtles; ſo that though it is much more bulky than a hare, it can paſs through a hole of not above two inches in diameter. *Travels in North America*, II. 109.

They have all our ſorts of wild and tame fowl in equal perfection with us, and ſome which we have not, with a vaſt number of birds of various kinds; *Cateſby* deſcribes between ninety and an hundred. The white owl of *Virginia* is much larger than thoſe of *England*, and is all over of a bright ſilver-coloured plumage, except one black ſpot upon his breaſt. The *Virginian* nightingale is a beautiful bird, whoſe colours are crimſon and blue. The mocking-bird is ſuppoſed to excel all others in the fineneſs of its note, and is remarkable for imitating the notes of all others. The rock-bird is very ſociable, and his ſociety very agreeable by the ſweetneſs of his muſic.

Of the *Virginian thruſhes* the *Marquis de Chaſtellux* thus ſpeaks: "I ſtopped ſome time, at ſun-ſet, to hear two thruſhes, which ſeemed to challenge each other to the ſong, like the ſhepherds of *Theocritus*. This bird ought, in my opinion, to be conſidered as the nightingale of *America*; it reſembles thoſe of *Europe* in its form, colour, and habits, but is twice as large: its ſong is ſimilar to that of our thruſh, but ſo varied, and ſo much more perfect, that if we except the uniform, plaintive notes of the *European* nightingale, they might be taken for each other. It is a bird of paſſage, like the mocking-bird; and, like it, ſometimes remains through the winter." *Travels*, II. 105.

The humming-bird, the ſmalleſt and moſt beautiful of the feathered race, has this remarkable peculiarity, that though it is feathered like a bird, it ſubſiſts like the bee by ſucking honey from the flowers. It is about one third part the ſize of a wren, and is ſhaped like it: its legs, which are about an inch long, appear like two ſmall needles. Theſe birds are of different colours; but the cocks are more beautiful than the hens, and are finely tinged with red, green, and gold, which, being expoſed to the ſun-beams, ſhine with wonderful luſtre. They have long bills and tails, conſidering their ſize, and in ſome of the larger flowers they often bury themſelves, and are quite covered while ſucking to the bottom of them, by which means they are often caught by children. They fly very nimbly, but more like inſects than birds, from flower to flower. The motion of their wings is incredibly ſwift, and produces a humming noiſe, not unlike that of a large humble bee. They breed during the heat of ſummer; but what becomes of them in the winter is not known. Their neſts are a great curioſity, and may be ſaid to be one of the fineſt pieces of workmanſhip the whole ſpecies of winged animals exhibit; for it commonly hangs on a ſingle briar, and is moſt artificially woven like a round ball, with a ſmall hole to go in and out. Within it the hen lays and hatches her eggs, which are oval, and no bigger than a ſmall pea. Many attempts have been made to ſend this bird alive to *England*, but they never proved ſucceſsful. The mocking-bird likewiſe could never be brought over. They preſently grow tame; and the *Marquis de Chaſtellux* ſaw one that had been taken a few days, which was not frightened at the perſons who looked at it, but flew about the room as in a garden, and ſucked the flowers which were preſented to it; but it did not live above a week. An inhabitant of the country, who amuſed himſelf in preſerving them for his cabinet, made uſe of a very ingenious method of taking them without disfiguring them, which is very difficult to be effected, as the ſmalleſt ſhot tears them to pieces: his method was, to load his gun with a bladder filled with water, the exploſion of which water was ſufficient to knock down the *humming-bird*, and deprive him of motion. *Travels*, II. 172.

There are here ſeveral ſorts of *eagles* and *hawks*. The *fiſhing-hawk* is very eager in catching fiſh when they firſt come in the ſpring; and the *bald eagle* no ſooner perceives a hawk that has taken any prey, but he immediately purſues and ſtrives to get above him in the air; which if he can once attain, the hawk, for fear of being torn by him, lets the fiſh drop, and thus compounds for his own ſafety; for the fiſh is no ſooner looſe from the hawk's talons, than the eagle ſhoots with ſuch inconceiveable ſwiftneſs that he catches it in the air. It is ſaid that the fiſhing-hawks, in very plentiful ſeaſons, will catch a fiſh and loiter about with it in the air, in order to have a chaſe with an eagle; and when he does not appear ſoon enough, will make a noiſe, as inſolently deſying him.

The troubleſome reptiles and vermin of this country are *frogs*, *ſnakes*, *muſkettos*, *chinches*, *ſeed-ticks*, or *red-worms*. In the ſwamps and running ſtreams are frogs of an incredible ſize, which are called *bull-frogs*, from their bellowing noiſe. Theſe are ſaid to be frequently ſix times as large as thoſe in *Europe*; but there are no toads in the country.

The *rattle ſnake* is ſo called from the rattles at the end of its tail, which is a connection of joints within a thin covering of a horny nature. The number of joints, or rattles, are uncertain, being more or leſs according to the age of the ſnake; ſome authors aſſerting, that every year there is the addition of a new rattle, and that theſe do not begin to grow till they are three years old. Mr. *Brickell* informs us, that he has ſeen one with thirty rattles. Mr. *Derham* and others have obſerved, that Providence has wiſely given theſe rattles to this poiſonous ſerpent, that the noiſe might be a warning to man and beaſt to avoid the approaching danger. Some of theſe reptiles grow to the length of ſix or ſeven feet, and they are about the thickneſs of the ſmall of a man's leg. Their ſkins are covered over with thin ſcales, with a ridge through the middle of them, of an orange tawny; the reſt of the back is generally of a blackiſh colour, beautifully mottled, and the belly of an aſh colour, inclining to lead. The top of the head is flat as in the viper, and by the protuberance of the jaws ſomewhat reſembles a bearded arrow; it has two noſtrils, and its eyes are round and very bright and ſhining. The mouth is very large: its tongue in all reſpects like that of a viper, which it darts out and retracts again with great agility. The male is eaſily diſtinguiſhed from the female by a ſpot on the head, reſembling a patch of black velvet, and his head is ſmaller and longer. They ſeldom or ever bite except they are provoked, and this they cannot do till they gather themſelves into a coil, and then will ſpring at a good diſtance to bite whatever provokes or injures them: otherwiſe they are moſt peaceable creatures, and never attack or moleſt any one. The teeth with which this ſerpent effects his poiſonous purpoſes, are not thoſe which he makes uſe of upon ordinary occaſions; they are only two in number, very ſmall, and ſharp pointed: they are fixed in a ſinewey ſubſtance, which lies in the extremity of the upper jaw, and in ſhape reſemble the claws of a cat; at the root of each of theſe, which may be extended, contracted, or entirely concealed, at the pleaſure of the animal, are two ſmall bladders, from whence, at the ſame inſtant that an inciſion is made by the teeth, a drop of a greeniſh liquor enters the wound: this is ſufficient to taint the whole maſs of blood.

Dr. *Brickell* obſerves, that the *Indians* frequently pull out theſe poiſonous fangs, which is eaſily done by tying a bit of red woollen cloth to the upper end of a long hollow cane, provoking the rattle-ſnake to bite, and then ſuddenly ſnatching it away, by which means the teeth are found ſticking faſt in the cloth.

Their common fruit is frogs, ground-mice, crickets, graſhoppers, and other inſects; and the rattle-ſnakes themſelves ſerve for food to bears, and even hogs will eat them without harm. They are viviparous, and generally bring forth about twelve young ones.

Some ſurpriſing inſtances of the venom of the rattle-ſnake's poiſon are given by captain *Hall*, who being in *South Carolina*, where perhaps the venom may be ſomewhat more violent than in this province, and where they are at leaſt more numerous, procured a fine healthful rattle-ſnake, and, with one Mr. *Kidwell*, a ſurgeon, and three or four other gentlemen, made ſeveral experiments. They got three cur-dogs, the largeſt no bigger than a common harrier; and the ſnake being tied and pinned down to a graſs-plot, they took the largeſt of the dogs, and having tied a cord round his neck, ſo as not to ſtrangle him, the captain held one end, and another perſon the other, when pulling the dog over the ſnake, the latter raiſed himſelf near two feet, and bit the dog as he was jumping. The dog yelped, by which the captain perceived he was bitten, and pulling the dog to him as faſt as he could, he found his eyes fixed, his tongue between his teeth, and in a quarter of a minute he was quite dead; but as they could neither perceive the bite, nor any blood, they ordered ſome hot water, and ſcalding off the hair, diſcovered only one puncture, with a bluiſh green colour appearing a little round it, on his breaſt between his fore-legs.

Half an hour after, they took a ſecond dog, that was ſomewhat ſmaller, and brought him in like manner over the ſnake, which bit his ear, ſo that all the company ſaw it. The dog yelped much, reeled and ſtaggered about for ſome time, then fell down and ſtruggled as if convulſed, and two or three times got up, and wagging his tail, though ſlowly, endeavoured to follow a negro boy, who uſed to make much of him. They put him into a cloſet, and ordered the boy to look after him, who two hours after brought word that the dog was dead.

About an hour after the ſecond dog was bitten, they took a third in like manner, which the ſnake bit on the right ſide of the belly, ſo that he drew blood. The dog for about a minute did not ſeem to be hurt, but was dead the next morning.

Four days after, they got two dogs, as big as common bull-dogs; and the firſt which the ſnake bit on the inſide of his left thigh, died exactly in half a minute, according to the watches of two gentlemen preſent, though no blood was drawn. The ſecond was bit about an hour after, on the outſide of the thigh, where they perceived blood at two places, and he died in four minutes. As they imagined the venom was not quite ſpent, they got a cat, which he bit an hour after; ſhe was very ſick, and was found dead the next morning.

The laſt experiment the captain made with this ſnake, was to try if his poiſon would not prove mortal to the reptile himſelf. In order to do this, he hung him in ſuch a manner that he was not above half his length on the ground, and then ſo irritated him by pricking and ſcratching him with two needles faſtened to the end of a ſtick, that he ſoon bit himſelf, after having ſeveral times attempted to bite the ſtick. He then let him down, and he was quite dead in eight or ten minutes. The ſnake was then cut into five pieces, and given to a hog, the head-part firſt, in the ſight of ſeveral people. The hog eat up all the ſnake, and ten or twelve days afterward the captain ſaw the hog alive and healthful. The bite of the rattle-ſnake is poiſonous to all living creatures, both human and brute, except the hog.

A remarkable proof of which is given by a late writer. *Diamond* iſland, in lake *George*, was ſo over-run with rattle-ſnakes, that no one when paſſing by it cared to land upon it. It happened that a batteaux, in ſailing up the lake, overſet near the iſland: among other things it contained were ſome hogs, who ſwam to ſhore, as did the *Canadians* who were rowing it. The latter, dreading the rattle-ſnakes, climbed trees for the night, and the next morning, obſerving another batteaux, they hailed the people in it, who took them in and conveyed them to *Fort George*. Some time after, the man who owned the hogs, being unwilling to loſe them, returned down the lake, and, with ſome companions, ventured a ſearch. After traverſing the iſland a conſiderable time, they at length found the hogs, but ſo prodigiouſly fat that they could ſcarcely move, and in their long ſearch they only met with one rattle-ſnake; which greatly ſurpriſed them, as thoſe reptiles were reported to ſwarm on the iſland; but their wonder ſoon ceaſed; for, being ſhort of proviſions, they killed one of the hogs, and found the ſtomach of the animal filled with rattle-ſnakes; ſo that the hogs had probably fed on nothing elſe whilſt they were on the iſland. *Travels into the interior parts of America*, I. 385.

The bite of this reptile is more or leſs venomous, according to the ſeaſon of the year in which it is given. In the dog-days it often proves inſtantly mortal, but in the ſpring, in autumn, or during a cool day even in ſummer, its effects may be counteracted by an immediate uſe of proper remedies: beſide the rattle-ſnake plant, which grows in great abundance, there are ſeveral other remedies, among which ſalt, applied to the part bitten, is found to be one, or waſhing the wound with brine; the fat of the reptile, rubbed on the wound, is very efficacious. Such perſons as are bitten by this ſnake, and ſurvive the hurt, annually experience a ſlight return of the dreadful ſymptoms about the time they received the bite.

The rattle-ſnake is charmed with melodious ſounds, whether vocal or inſtrumental. "I have many times," ſays our Author, "ſeen them, even when they have been enraged, place themſelves in a liſtening poſture, and continue motionleſs with attention and delight ſo long as the muſic has been heard." *Carver's Travels*, p. 479. The ſame writer ſays, he killed a female of this ſpecies that had ſeventy young ones in its belly, perfectly formed: theſe he had ſeen retire into the mouth of the mother on his approach. *Idem, p.* 483.

But beſide the effect of the poiſon, there are others attributed to the eyes of this ſerpent that appear much more ſurpriſing; and we have many accounts that ſeem to prove that the rattle-ſnake, by fixing his eyes on any ſmall animal, as a bird or ſquirrel, though ſitting on the branch of a tree, can ſo diſorder its animal ſpirits, that it has not the power to fly, but falls down, and is ſwallowed by that dreadful reptile. The following inſtance given by captain *Beverly*, proves this.

The above gentleman, with two other perſons in company, ſtopping at an orchard by the ſide of a road, one of the company ſearching for cherries eſpied a leveret ſitting; and though he went cloſe by her ſhe did not move, till he, not ſuſpecting the occaſion of her tameneſs, gave her a laſh with his whip; upon which ſhe ran three or four yards, and ſat down again. The gentleman not finding the fruit ripe, immediately returned the ſame way; and, near the place where he ſtruck the hare, obſerved a rattle-ſnake. Not ſuſpecting the charm, he went back about twenty yards, to a hedge, to get a ſtick to kill the ſnake, and at his return found it removed; and coiled in the ſame place from whence he had driven the hare. This made him look about for her, whom he ſoon eſpied about ten feet diſtant from the ſnake, in the place to which ſhe had ſtarted when he whipped her. She was now lying down, but would ſometimes raiſe herſelf on her fore-feet, ſtruggling, as it were for life, to get away; but could never raiſe her hinder parts from the ground; and then ſhe would fall flat on her ſide again, panting vehemently. The hare and ſnake were in this condition when our author was called, who ſays, that though all three went within five yards of the ſnake, to have a full view of the whole, the ſnake did not ſo much as give a glance toward them. They ſtood there at leaſt half an hour, the ſnake not making the ſmalleſt motion; but the hare often ſtruggled to get up, and fell again on its ſide; till at laſt ſhe lay ſtill as if dead. The ſnake then moved out of his coil, and ſlid gently and ſmoothly toward the hare, his colours at that inſtant ſhining ten times more bright than at other times. As the ſnake moved along, the hare happened to make another ſtruggle, upon which the ſnake made a ſtop, lying at his length till ſhe was quiet, and then advanced till he came up to the hare's hinder parts, which in all this proceſs had been toward the ſnake. There he ſurveyed the hare all over, raiſing part of his body above it; then turning off, he went to the noſe, and after that to the ears, which he took into his mouth one after another, working them as a man does a wafer to moiſten it. He then returned to the noſe, and took the face into his mouth, ſtraining and gathering his lips ſometimes on one ſide ſometimes on the other. At the ſhoulders he was a long time puzzled, often pulling and ſtretching the hare out at length, till at laſt he got the whole body into his throat. The ſpectators then advanced, and our author taking the twiſt-band off his hat, made a nooſe, and threw it about the ſnake's neck. This made him very furious; but having ſecured him, they put him into one end of a wallet, and carried him on horſeback, five miles, to the houſe where they lodged that night, and killing him the next morning, took the hare out of his belly. The head began to be digeſted, and the hair to fall off, having lain in the ſnake's belly about eighteen hours.

Mr. *Burnaby* relates, that he met with a perſon who had been an eye-witneſs of this phænomenon in nature, the faſcinating power of the rattle-ſnake. He obſerved a ſnake coiled near a tree, looking directly at a bird which had ſettled there. The bird was under great agitation, uttered the moſt doleful cries, hopped from ſpray to ſpray, and at length, flew directly down to the ſnake, who opened his mouth and ſwallowed it. *Travels, p.* 45.

Here are ſeveral other ſnakes which are more frequently ſeen, ſome of which are not venomous, as the *black-ſnake*, the *water-ſnake*, and the *corn-ſnake*; but the *black viper-ſnake*, and the *copper-bellied-ſnake*, are ſaid to be extremely venomous. Theſe latter poiſonous ſnakes bring forth their young alive, while the other three lay eggs. There is here alſo the *horn-ſnake*, which is ſo called from a ſharp horn in its tail, with which it aſſaults any thing that offends it with ſuch force, that it will ſtrike its tail into the but-end of a muſket ſo far as to be unable to diſengage it.

No place abounds with ſea and river-fiſh more than *Virginia*. In February, March, April, and May, ſhoals of *herrings* come up into the very brooks, ſome of the ſize of ours; but moſt of them are much larger. There is alſo plenty of *cod* and *ſtingraſs*, the latter a fiſh peculiar to this country, and ſo called from having a ſting in its tail; it is eſteemed good food. In the rivers are *ſturgeon*, *old-wife*, the *ſheep's-head*, an excellent fiſh; *trouts*, and *green-fiſh*, in great plenty; alſo *plaice*, *flounders*, *whitings*, *carp*, *pike*, *mullets*, and *perch*; and of ſhell-fiſh, they have *crabs*, *oyſters*, *cockles*, and *ſhrimps*. Here is alſo a fiſh called the *toad-fiſh*, from its ſwelling prodigiouſly when taken out of the water; and likewiſe the *rock-fiſh*, ſome ſpecies of which are poiſonous.

"*Sturgeon* and *ſhad*," ſays *Mr. Burnaby*, "are in ſuch prodigious numbers, that one day, within the ſpace of two miles only, ſome gentlemen, in canoes, caught above 600 of the former with hooks, which they let down to the bottom, and drew up at a venture when they perceived them to rub againſt a fiſh; and of the latter, above 500 have been caught at one ſingle haul of the ſeine." *Travels, p.* 15.

Annually, in the month of June, there are here vaſt numbers of worms, which enter the bottoms of ſhips, ſloops and boats, wherever they can find the coat of pitch, tar, and lime worn off the timber, and by degrees eat the planks into cells like thoſe of an honeycomb. Theſe worms continue upon the ſurface of the water from their riſe in June till the firſt great rains, about the middle of July; but after that, do no great damage till the next ſummer-ſeaſon, and never penetrate farther than the plank upon which they firſt fix.

The Diviſions of Virginia *and its Towns.*

Virginia is divided into ſeventy-four counties, of very unequal ſize and population: eight of theſe are between the *Blueridge* and *Allaghany* mountains; and eight are weſtward of the *Allaghany*. The moſt conſiderable of the counties are *James* county, which is ſeated on both ſides the river *James*, *Prince George* county, *Henrico* county, *Charles* county, *Surry*, *Iſle of Wight*, *Nanſamond*, *Norfolk*, *Princeſs Anne*, *Amelia*, *Auguſta*, *York*, *Warwick*, *Elizabeth*, *New Kent*, *King William*, and *Queen*, *Glouceſter*, *Middleſex*, *Eſſex*, *Richmond*, *Stafford*, *Weſtmoreland*, *Lancaſter*, *Northumberland*, *Northampton*, *Acomat*, *Amherſt*, *Frederic*, *Lincoln*, *Jefferſon*, *Fayette*, *Monongalia*, *Yohagania*, and *Ohio*.

The ſtate, by another diviſion, is formed into pariſhes; ſome counties comprehend more than one pariſh, and ſome pariſhes more than one county. A parſon of the *Engliſh* church, with a fixed ſalary, is appointed for each pariſh: but no good underſtanding ſubſiſts between the clergy and the people. In many churches divine ſervice is performed only once a month, and then to a congregation conſiſting of not more than a dozen people. The care of the poor is a parochial obligation.

JAMES TOWN, is ſeated on a peninſula formed by *James* river, about forty miles from its mouth. It contains only about eighty or a hundred houſes, the greateſt part of which are taverns or public-houſes for the entertainment of mariners.

WILLIAMSBURGH, until the year 1780, the capital of *Virginia*, and the ſeat of government, is ſeven miles from the above town, and twelve from *York*, the road between which is extremely pleaſant, being amidſt ſome of the fineſt tobacco plantations in *America*. It is ſituated between *James* river and *York* river. It never contained more than 1800 inhabitants.

The COLLEGE of WILLIAM and MARY in this town, is a noble eſtabliſhment, and the only public ſeminary of learning in this ſtate. It was founded in the reign of *William* and *Mary*, who granted to it 20,000 acres of land, and a penny a pound duty on certain tobaccos exported from *Virginia* and *Maryland*, which had been levied by the ſtatute of 25th *Car.* II. the aſſembly likewiſe gave it, by temporary laws, a duty on liquors imported, and ſkins and furs exported; from which reſources it receives, one year with another, 3000*l.* The buildings are of brick, and ſufficient to accommodate an hundred ſtudents. By its charter, it was to be under the government of twenty viſitors, who were to be its legiſlators. It was likewiſe to have a preſident and ſix profeſſors. The ſixth profeſſorſhip was founded by the great *Mr. Boyle*, who bequeathed to it a very liberal endowment. The object which the founder had in view by this inſtitution was, the inſtruction of the *Indians*, and their converſion to Chriſtianity. This is called, "The *Brafferton* profeſſorſhip," from the name of the eſtate in *England*, which was purchaſed with the money bequeathed. Since the revolution, the viſitors have changed the objects of the profeſſorſhips, which now are, law and police: anatomy and medicine: natural philoſophy and mathematics: moral philoſophy, the law of nature and nations, the fine arts: modern languages: and the *Brafferton*. *Mr. Jefferſon* very juſtly obſerves, that the object of the latter profeſſorſhip would be very uſefully extended to the collecting the traditions of the Indians, and acquiring a thorough acquaintance with their laws, cuſtoms, languages, and every particular which might lead to a diſcovery of their relation with one another, or deſcent from other nations.

NORFOLK, the moſt flouriſhing town in *Virginia*, ſtands on an inlet, near the ſouthern entrance of the *Cheſapeak*. It is become the emporium of the trade of the *Cheſapeak*; but though by far the moſt populous town in the ſtate of *Virginia*, it contains, according to *Mr. Jefferſon*, no more than 6000 inhabitants. *Notes on Virginia, p.* 175.

In the ſpring of the year 1790, there were one hundred and fifty ſail of ſhipping lying in the harbour of *Norfolk*.

The other towns, or more properly villages or hamlets, are *Portſmouth*, *Hampton*, *Suffolk*, *Smithfield*, *Peterſburg*, *Richmond*, the ſeat of government; *Mancheſter*, *Charlotteſville*, and *New London*, on *James*' river and its waters: *York*, *Newcaſtle* and *Hanover*, on *York* river: *Urbanna*, *Portroyal*, *Frederickſburg*, and *Falmouth*, on *Rappahannoc*: *Dumfries*, *Colcheſter*, *Alexandria*, *Wincheſter* and *Staunton*, on *Potowmac*: *Louiſville*, on *Ohio*.

By a cenſus taken in the year 1782, the number of inhabitants were then calculated to amount to 567,614, of which 270,762 were ſlaves. Theſe are ſuppoſed to multiply faſter than the whites. The firſt ſeſſion held under the republican government, the aſſembly paſſed a law for the perpetual abolition of the importation of ſlaves. "This," ſays *Mr. Jefferſon*, "will in ſome meaſure ſtop the increaſe of this great political and moral evil; while the minds of our citizens may be ripening for a complete emancipation." *Notes on Virginia, p.* 146.

The following curious fact is related by the ſame author. "An anomaly in nature," ſays he, "ſometimes takes place in the race of negroes brought from *Africa*, who, though black themſelves, have, in rare inſtances, white children, called *Albinos*. I have known four of theſe myſelf, and have faithful accounts of three other. They are all of a palid cadaverous white, untinged with red, without any coloured ſpots or ſeams. Their hair of the ſame kind of white, ſhort, coarſe and curled as in that of the negro. All of them well formed, ſtrong, healthy, perfect in their ſenſes, except that of ſight, and born of parents who had no mixture of white blood. Three of theſe *Albinos* were ſiſters, having two other full ſiſters who were black. Two of them had iſſue by a black man, which iſſue was black. The *Albinos* are uncommonly ſhrewd, quick in their apprehenſion, and in reply. Their eyes are in perpetual tremulous vibration, very weak, and much affected by the ſun; but they ſee better in the night than we do. The fourth inſtance was of a negro woman whoſe parents came from *Guinea*, and had three other children who were of their own colour. She was freckled; her eye-ſight ſo weak that ſhe was obliged to wear a bonnet in the ſummer; but it was better in the night than in the day. She had an *Albino* child by a black man, which died a few weeks after its birth. A ſixth inſtance was a woman, ſtout and robuſt, who had iſſue a daughter jet black, by a black man." The ſeventh inſtance was a male, whoſe eyes were tremulous and weak; he was tall of ſtature and advanced in years: this was the only male of the *Albinos* whom our author had heard of. "Whatever may be the cauſe," he adds, "of the diſeaſe in the ſkin, or in its colouring matter, which produces this change, it ſeems more incident to the female than male ſex. To theſe I may add, the mention of a negro man within my own knowledge, born black, and of black parents; on whoſe chin, when a boy, a white ſpot appeared. This continued to increaſe till he became a man, by which time it had extended over his chin, lips, one cheek, the under jaw, and neck on that ſide. It is of the *Albino* white, without any mixture of red, and has for ſeveral years been ſtationary." *Jefferſon's Notes, &c. p.* 118. Appearances exactly ſimilar to thoſe related above, have been ſeen on the iſland of *Otaheite*, in the *South Sea*, and are mentioned by *M. Bougainville*, and by *Mr. Foſter*, in his Account of *Capt. Cook's* ſecond voyage, II. 85. *M. de Pau* enters very fully into a diſcuſſion of this curious ſubject, in his *Recherches ſur les Americains*, IVieme *partie*, *ſect.* I. On the iſthmus of *Darien*, inſtances of ſuch *luſus naturæ* ſometimes appear, where they are called *Blafards*. According to this writer, the *Portugueſe* gave them the name of *Albinos*, but in *Africa* they are called *Dondos*, and in the *Eaſt Indies*, *Kackerlakes*, which is derived from the *Malay* language; the *French* call them *white negroes*.—But to return.

Every able-bodied freeman, between the age of ſixteen and fifty, is enrolled in the militia. Thoſe of every county are formed into companies, and theſe again into one or more battalions, according to the numbers in the county.

The *Virginians* have been characteriſed as remarkably indolent and good tempered, extremely fond of ſociety, and delighting in convivial pleaſures. They are diſtinguiſhed by their hoſpitality to ſtrangers; they ſhew no ſpirit of enterpriſe, and are averſe to fatigue; to relieve them from which they have a numerous attendance of ſlaves. They are little intent on improving their fortunes, and frequently live in a ſtyle much beyond their incomes. Their chief magnificence conſiſts in furniture, linen and plate. They ſometimes diſſipate their fortunes by gaming, hunting and horſe-racing. The women are ſomewhat handſome, but ſeldom accompliſhed; and in general reſerved: their only amuſement is dancing, of which they are immoderately fond. The *Marquis de Chaſtellux* ſays, "the indolence and general diſpoſition of the middling and lower claſſes of the white inhabitants, are ſuch as to give pain to every reflecting mind: horſe racing, cock fighting, and boxing matches, are ſtanding amuſements, for which they neglect all buſineſs, and in the latter of which they conduct themſelves with a barbarity worthy of their ſavage neighbours: the ferocious practice of ſtage-boxing in *England*, is urbanity compared with the *Virginian* mode of fighting. *Travels* II. 192.

Mr. Jefferſon eſtimates the whole taxable property of this ſtate at 100,000,000 of dollars; from which he ſuppoſes a capacity of raiſing one million, or a million and a half of dollars annually: the annual expences of the ſtate he rares at 250,000 dollars excluſive of the military expence, and of the public debts. Of the latter he gives no account.

The eſtabliſhed religion is that of the Church of *England*: every pariſh has its miniſter, who has a houſe and glebe, with about the value of eighty pounds *per annum* paid him in tobacco, which the churchwardens collect for him. The eccleſiaſtical affairs are now under the government of a biſhop, who is ſtyled biſhop of *Virginia*. But though full liberty of conſcience is allowed to people of all perſuaſions, there are few diſſenters from the eſtabliſhed church.

HISTORY.

Virginia, which was diſcovered by *John Cabot*, is the moſt ancient *Engliſh* ſettlement in *North America*. Sir *Walter Raleigh*, who was the firſt *Engliſhman* that diſcovered the advantages to be derived from making foreign ſettlements, having, with much difficulty, obtained the concurrence of government, formed a company, compoſed of ſeveral perſons of diſtinction and ſome eminent merchants, who agreed to ſettle a colony in that part of the world, which, in honour of queen *Elizabeth*, he named *Virginia*. The ill ſucceſs that attended the firſt ſettlements gave ſmall hopes of a proſperous iſſue; one half of the colony was deſtroyed by the *Indians*, and the reſt, conſumed and worn out by fatigue and famine, returned home to their native country: the ſecond colony was cut off to a man in a manner unknown; but was ſuppoſed to be deſtroyed by the *Indians*: the third had the ſame unhappy fate; and the fourth quarrelling among themſelves, neglected agriculture to hunt for gold, and exaſperating the *Indians* by their inſolent behaviour, loſt ſeveral of their people, and the poor remains of them were returning in a famiſhing condition to *England*, when, juſt in the mouth of *Cheſapeak-bay*, they met the lord *Delawar* with a fleet of ſhips laden with proviſions, and every thing neceſſary for their relief and defence. This ſeaſonable ſupply induced them to continue here.

This nobleman endeavoured with the utmoſt zeal and aſſiduity to cheriſh and ſupport the froward infancy of this unpromiſing colony. After he had prevailed on the people to return, he comforted them under their miſfortunes, pointed out the cauſes of them, and uniting the tenderneſs of a father with the ſteady ſeverity of a magiſtrate, healed their diviſions, and reconciled them to authority and government, by making them feel by his conduct what a bleſſing it could be made. Having ſettled the colony within itſelf, his next care was to put them upon a proper footing with reſpect to the *Indians*, who had been too often treated ill, and whom he now found very haughty and aſſuming on account of the miſerable ſtate to which the *Engliſh* had been reduced; but by ſome well-timed and vigorous, though cruel ſteps, he awed them into a peaceable diſpoſition; and having ſettled his colony in a very thriving condition, returned home, leaving his ſon, who poſſeſſed the father's ſpirit, as his deputy, aſſiſted by a council.

Lord *Delawar*, on his return to *England*, did not forget the colony. For eight years together he was indefatigable in doing every thing that could tend to the peopling, the ſupport, and the good government of this ſettlement; and he died purſuing the ſame object, on his voyage to *Virginia* with a large ſupply of people, cloathing, and goods.

The colony of *Virginia* took ſuch ſtrong root under the care of lord *Delawar*, that it was enabled to ſtand two terrible ſtorms, in which the injured *Indians* had nearly cut off that colony, and to ſubdue them ſo as to put it entirely out of their power to give the *Engliſh* the leaſt diſturbance for many years. After the death of *Charles* I. Sir *William Berkley* held out for the crown, till the province was reduced by the parliament.

Soon after the Reſtoration a rebellion aroſe in the province; miſmanagement in the government, the decay of trade, and exorbitant grants, having cauſed a general diſcontent among the planters, which was kindled into actual war, by a young gentleman named *Bacon*, who poſſeſſed very popular talents. By a ſpecious, or perhaps a real, regard for the public good, finding the governor ſlow in his preparations againſt the *Indians*, who were then ravaging the frontiers of the province, he took up arms without any commiſſion to act againſt the enemy. When he had ſufficient force for this purpoſe, he found himſelf in a condition not only to make head againſt the *Indians*, but to give law to the governor, and to force him to ſanction by his authority thoſe proceedings which he aimed at ſuppreſſing.

Bacon at length, armed with the commiſſion of a general, marched againſt the *Indians*, followed by the whole force of the colony; when Sir *William Berkley*, the governor, being freed from the immediate terror of his forces, proclaimed him a traitor, and iſſued a reward for apprehending him. Upon this the people were univerſally inflamed, and adhered to *Bacon*, while the governor, who was unwilling to temporiſe, or yield to the ſtorm, retired over the river *Potowmac*, proclaimed all *Bacon*'s adherents traitors, put himſelf at the head of a ſmall body of troops, which he raiſed in *Maryland*, and of ſuch *Virginians* as were faithful to him, and wrote to *England* for ſupplies.

Meanwhile *Bacon* marched to the capital, called an aſſembly, and for ſix months together diſpoſed of every thing according to his own pleaſure. Things were now brought to a criſis, and haſtening to a civil war, when the public tranquillity was reſtored by *Bacon*'s death, and the arrival of a regiment from *England*: and it muſt be obſerved, to the honour of the government, that no perſon ſuffered in his life or eſtate for this inſurrection, which was the more extraordinary, as many people were then very earneſtly ſoliciting grants of land in this country.

From that time the colony remained in a peaceable ſtate, until the impoſition of the ſtamp-act, in the year 1765, excited the moſt violent and outrageous diſcontent. Sharp altercations between the people and lord *Dunmore*, the governor, ſucceeded; and the ſpirit of hoſtility at length roſe to ſuch a height, that the governor was compelled to ſeek his ſafety on board a ſhip of war then lying in the harbour. Not long after which the declaration of independence was made.

On the firſt ſettlement of *Virginia*, in the year 1607, the country from the ſea coaſt to the mountains, and from *Potowmac* to the moſt ſouthern waters of *James*' river, was occupied by upward of forty different tribes of Indians. Of theſe the *Powhatans*, the *Mannahoacs*, and the *Monacans* were the moſt powerful, and with one or other of theſe the ſmaller tribes were in alliance. The *Monacans* and their friends, were in amity with the *Mannahoacs* and their friends, and waged joint and perpetual war againſt the *Powhatans* and their friends. The territories of the *Powhatan* confederacy S. of *Patowmac* river, comprehended about 8000 ſquare miles, thirty tribes, and 2400 warriors. They occupied the coaſt on the eaſtward, whilſt the other tribes, who were much leſs numerous and powerful, inhabited weſtward, among the mountains. Theſe three nations are ſaid to have ſpoken languages radically different. In the ſpace of ſixty-two years they were reduced to about one third of their former numbers: ſpirituous liquors, the ſmall pox, war, and an abridgment of territory, to a people who lived principally on the ſpontaneous productions of nature, had committed terrible havock among them. Theſe Indians have either been compelled by force, or cajoled by inſidious arts, to ſurrender up their country; and ſcarce a trace of them is now left.

North and South Carolina.

THE provinces of *North* and *South Carolina*, lying between 31°. and 36°. N. latitude, are upward of four hundred miles in length, and in breadth to the *Indian* nations near three hundred. *North Carolina* is bounded on the E. by the *Atlantic* ocean, on the S. by *South Carolina*, on the W. by the *Apalachian* mountains, and on the N. by *Virginia*. The coaſts are extremely broken by bays, creeks, and rivers, in the openings of which are many bars and ſhoals, which render the navigation difficult to ſtrangers: there are, however, ſeveral ſafe and good harbours.

The climate and ſoil of both *Carolinas* are not very different from thoſe in *Virginia*. Indeed the heat in ſummer is greater, but the winters are milder and ſhorter. The weather, though in general ſerene, and the air healthy, yet, like all *American* weather, makes ſuch quick changes as obliges the inhabitants to obſerve more caution, in their dreſs and diet, than thoſe in *Europe* are conſtrained to uſe. Thunder and lightning are very frequent, and the ſouthern parts of *North America* are ſubject to hurricanes; but they are here very rare, and not near ſo violent as thoſe of the *Weſt Indies*. Part of the month of March, all April and May, and the greateſt part of June, are here extremely temperate and agreeable; but in July, Auguſt, and for almoſt the whole of September, the heat is very intenſe; and though the winters are ſharp, eſpecially when the N. W. wind prevails, yet the cold is ſeldom ſevere enough to freeze any conſiderable body of water. It is chiefly felt in the mornings and evenings; for the froſt has never ſufficient ſtrength to reſiſt the noon-day's ſun; ſo that many tender plants, which do not ſtand the winter in *Virginia*, flouriſh in *Carolina*.

The whole country, where it is not yet cleared, is in a manner one foreſt. The trees are almoſt the ſame in every reſpect with thoſe produced in *Virginia*; and by the different ſpecies of theſe the quality of the ſoil is eaſily known: thus the ground which bears the *oak*, the *walnut*, and the *hickery*, is extremely fertile; it is of a dark ſand, intermixed with loam; and as all the land abounds with nitre, it is long before it is exhauſted; for here they never uſe manure. What is called the pine-barren is the worſt, it conſiſting of a white ſand, yet naturally bears the pine, and other uſeful trees; thoſe trees yield good profit in pitch, tar, and turpentine: when this land is cleared, it produces for two or three years together tolerable crops of *Indian* corn and peas; and when it lies low, and is flooded, anſwers well for rice; but what is the greateſt advantage to this province is, that the worſt of its land is favourable to the growth of one of the kinds of indigo, which is the moſt valuable of all its products. There is another ſort of ground low and marſhy, on the banks of ſome of the rivers, and is in ſome places uſeleſs; but in others is far the richeſt of all their grounds, it conſiſting of a black fat earth that bears their great ſtaple, rice, which requires a rich moiſt ſoil.

The country near the ſea and at the mouths of the navigable rivers is much the worſt; for moſt of the land there is a pale, light, ſandy-coloured ground; but the country on advancing farther into it continually improves; and at a hundred miles diſtance from *Charles Town*, where it begins to grow hilly, the ſoil is extremely fertile, the air pure and wholeſome, and the ſummer heats much more temperate than in the flat country; for *Carolina* is for eighty miles from the ſea an even plain, in which is no hill, no rock, and ſcarce even a pebble to be found. Wheat grows extremely well in the back country, and yields a prodigious increaſe. In the other parts of *Carolina* they raiſe but little wheat, it being apt to mildew, and grow into ſtraw; the planters therefore turn their whole attention to the culture of rice, which is more profitable, and in which they are unrivalled, they being ſupplied with what wheat they want, in exchange for this grain, from *Pennſylvania* and *New York*.

In the two provinces of which *Carolina* is compoſed are ten navigable rivers, that have very long courſes, and a great number of ſmaller ones that fall into them, all abounding in fiſh: but in moſt of the great rivers there are falls at fifty or ſixty miles diſtance from the ſea, and theſe become more frequent toward their ſources.

Here are ſeveral ſorts of *rice*, ſome of which are bearded, beſide the white and the red; but the white is the beſt. The rice of *Carolina* is eſteemed as good as any brought to *Europe*, and increaſes ſo prodigiouſly, that one meaſure ſown yields from eight hundred to a thouſand. It grows beſt in wet and wild land, that has never been cultivated or broken up before.

Indian corn, or *maize*, proves a moſt uſeful grain in theſe parts, it being in great plenty all over the province. *Millet* alſo does very well here, eſpecially in light and looſe ground: they ſow it in April and May, and it proſpers beſt in moiſt and rainy weather; but the abundance of other grain cauſes little of this to be ſown, it being only uſed in *Carolina* for fattening their poultry. *Guinea wheat* likewiſe thrives very well here, and ſerves for the ſame uſe as the former.

There are ſeveral ſorts of *pulſe* in this province, as the *buſhel-bean*, ſo called from one bean producing a buſhel; the *miraculous pea*, ſo called from its long pods and prodigious increaſe; the *bonavis*, *calivances*, *nanticoaces*, and ſeveral other kinds, all of which are excellent food. There are likewiſe *kidney-beans*, and the large *European bean*; but this laſt degenerates: yet there are ſeveral ſorts of *European peas*, which come to as great perfection in the *Carolinas* as in moſt parts of *Europe*.

Here are likewiſe a great variety of *garden-roots*, *pot-herbs*, and *ſallads*; with *pompions*, *caſhaws*, *ſquaſhes*, and many others.

Among the medicinal plants are *aſarabacca*, *carduus benedictus*, *ipecacuanha*, *ſarſaparilla*, *baſtard china-root*, and many more: with the valuable *indigo* plant, and others uſed in dyeing.

The fields and woods are adorned, like thoſe of *Virginia*, with a vaſt variety of *flowers*, among which are many of thoſe raiſed with great care in our gardens, and others peculiar to *America*.

The foreſt-trees are likewiſe very numerous; among theſe are many kinds of *oak*, the *aſh*, *ſycamore*, the *elm*, the *beech*, four ſorts of *pine*, the *ſervice-tree*, the *maple*, *horn-beam*, and the *cypreſs*. This laſt is not an evergreen in *Carolina*, the leaves turning red in winter, and not recovering their verdure till the ſpring. They are the talleſt and thickeſt of any trees in this part of the world, ſome of them being above thirty-ſix feet in circumference: the nuts they bear yield an odoriferous balſam uſed as a cure in all green wounds, gonorrhœas, and in fluxes. The planters and *Indians* commonly make their periaguas and canoes of this wood, and ſome of theſe periaguas are ſo large that they will carry thirty or forty barrels of pitch or tar, though formed of one entire piece of timber. Of theſe trees are likewiſe made curious pleaſure-boats.

Here are alſo in the foreſts the *mulberry*, the *hickery*, which is of the walnut kind, and is of three ſorts, the *white*, the *red*, and the *flying-barked hickery*, ſo called from its brittle and ſcaly bark; the *black-walnut tree*, the *cheſnut-tree*, the *honey-tree*, and the *ſugar-tree*.

The *palmetto-tree*, when at its full growth, is forty or fifty feet in height, and about two feet in diameter. The leaves grow only in great cluſters on the top, and are exactly in the form of a fan.

The *ſweet gum-tree* receives its name from a fragrant gum it yields in ſpring, by making an inciſion in the bark and wood. This gum is uſed internally as a remedy for ſeveral diſorders, and outwardly for cutaneous complaints.

The *black gum-tree* bears a well-taſted black berry, and the *white gum-tree* has flowers in bunches, and its wood is beautifully veined; ſeveral kinds of curious furniture are made with its wood.

The *cedar-tree* is here of two ſorts, the red and white. The red cedar is encompaſſed with a vaſt number of branches, which gradually ſhortening as they approach the top of the tree, form an exact pyramid. The leaves are ſmall and round, like thoſe of the pine, but ſhorter and not ſo ſharp-pointed; it bears berries all the year, which are ſweet and pleaſant to the taſte. Of this wood tables and other furniture are made, rooms are wainſcotted with it, and of it are made coffins for the dead. It is admired for its fragrant ſmell and its durability, for no worms will touch it.

The *tulip-tree* grows here to ſo large a ſize, that the trunk is ſometimes above twenty feet in circumference. Some of theſe trees bear white tulips, and others thoſe that are party-coloured. The wood makes handſome tables, &c.

The *bay-tree*, and the *bay-tulip-tree*, are beautiful ever-greens.

The *ſaſſafras* is very common, and the trunk is ſometimes two feet in diameter. The wood, which is light and durable, is, notwithſtanding its medicinal virtues, uſed for poſts, and other things deſigned to ſtand in the ground.

The *ſumach-tree* grows about nine or ten feet high, with ſoft and hairy leaves, indented on the edges, and a red ridge running through the midſt of them. The flowers which come forth in July are of a greeniſh yellow, and grow with the leaves in long red ſtalks in cluſters, after which follow ſmall reddiſh ſeeds in bunches like grapes. This tree is of great uſe in *Europe* in dreſſing ſkins, and eſpecially *Spaniſh* leather.

Many of the fruits of *Great Britain* grow wild in the woods, and of theſe are all the kinds we have mentioned in treating of *Virginia*; with a number of other *American* fruits, of which we ſhall only mention the following:

The *papau-tree* is only about eight or ten inches in diameter, but has the broadeſt leaves of any of the trees in the woods of *Carolina*. It bears a fruit about the ſize of a hen's egg, which reſembles an apple, but contains a large ſtone within it. When it is ripe it is of a beautiful yellow, and very ſoft and ſweet; of it the planters make puddings, tarts, and many other diſhes.

The *Indian fig*, commonly called the *prickly-pear*, is an admirable plant, which grows in great plenty, and ſeems to be nothing but a multitude of leaves, or a tree made of leaves, without trunk or boughs: for a leaf ſet in the ground takes root and produces other leaves, growing one above another till they reach the height of a tree. Upon this plant grow certain excreſcences, in which the *cochineal inſect*, ſo much valued for dying the richeſt ſcarlet, is ſaid to be bred.

ANIMALS.

THE *horſes* bred in the *Carolinas*, are well ſhaped, ſwift, and generally about thirteen or fourteen hands high; they will travel incredible journies, though they are never ſhod, on account of the ſoftneſs of the ground, which is covered over with graſs without any gravel or ſtones; yet the planters generally uſe them very ill, and ſeldom allow them corn after long journies. They frequently tie them to a tree for hours together, and ſometimes for a day or two, without giving them any ſubſiſtence; on which account the horſes ſometimes break looſe, and run into the woods, where they remain for weeks together with ſaddles on their backs. Such horſes as are kept in incloſures, and ſometimes fed with *Indian* corn, are very ſerviceable in journies and make good hunters.

When the planters hunt the wild horſes in the woods, they go two or three together on horſeback, and as ſoon as they eſpy a wild horſe, purſue him: and indeed their horſes are ſo well trained, that they will neither hurt themſelves nor their riders againſt a tree, and will go full ſpeed for hours together, till the wild horſes ſtand ſtill, when one of the hunters alights, claps the bit into his mouth, and a ſaddle on his back, and rides him to his home, or the next plantation; where he is fed with *Indian* corn and ſalt, which in a little time renders him perfectly tame, and fit to purſue his wild ſpecies in the woods.

The *ſheep* have generally two or three lambs at a time, and are never ſuffered, like the other cattle, to ramble in the woods; but are kept in incloſures in the plantations, from whence they come every evening to the planter's houſes, and at night are put into folds to defend them from the wild beaſts. The mutton is generally exceedingly fat, and as well reliſhed as any in *Europe*. Their wool is fine and valuable.

Swine are exceedingly numerous, and the pork is ſaid to excel that of *Europe*; the plenty of acorns, nuts, ſtrawberries, and other fruit to be found in the woods, giving a moſt agreeable taſte to their fleſh.

That ſingular animal the SKUNK has been already mentioned, p. 665, col. 2; but as that animal is native here, as well as in the northern parts, we ſhall give a more particular account of him, from a well informed native of the country. This creature lives chiefly in the woods, and about hedges, but its extraordinary quality is only diſcovered when it is purſued. As ſoon as he finds himſelf in danger, he ejects, to a great diſtance, from his poſteriors, a ſmall quantity of water, of ſo ſubtil a nature, and ſo ſtrong a ſmell, that the air is tainted with it for half a mile round; and his purſuers, whether dogs or men, being almoſt ſuffocated with the ſtench, are obliged to deſiſt from the chace. If a drop of this liquor falls on cloaths, it is impoſſible ever after to wear them; if any of it enters the eye, the pain it produces is intolerable, and frequently cauſes the ſight to be loſt. The ſmell which the ſkunk produces is like a ſtrong fœtid effluvia of muſk, which diſpleaſes rather from its penetrating power than from its nauſeouſneſs. It is however conſidered as beneficial in clearing the head, and is ſuppoſed to have the property of exhilarating the ſpirits. Naturaliſts have ſuppoſed this water to be the urine of the animal, but our author, who diſſected ſeveral, which he had ſhot, found in all a ſmall bag, near the urinal veſſels, but totally diſtinct from the bladder, in which bag was depoſited the loathſome liquid. He likewiſe ſays, that after having, with great care, taken out this bag, he had frequently fed upon the animal, and found its fleſh very ſweet and good; but if a ſingle drop of liquor chances to be diſcharged, it taints not only the whole body, but the houſe, and renders every kind of proviſion in it unfit for uſe. *Carver's Travels*, p. 450. See an account of the *ſtink-box* of the *Cape of Good Hope*, Vol. I. p. 360.

Among the wild beaſts are *buffaloes*, *elks*, *ſtags*, *fallow-deer*, *bears*, *jackalls*, *panthers*, and *tygers*.

The *American tyger* is ſaid to be the fierceſt animal of this country; his ſkin is of a ſallow colour, moſt beautifully mottled with ſeveral kinds of ſpots, and larger than a greyhound.

The *fire-fly* lives in the open air, and is ſo called from its appearing at night like a ſhining ſpark of fire. Their light is under their wings. Dr. *Brickell* ſays, that he has frequently taken them, and breaking off their wings, placed them on a book in a dark room, and whatever way they went, he could plainly ſee the letters. They appear in May, and remain moſt part of the ſummer, when they are ſometimes ſo numerous that the woods ſeem covered with ſparks of fire. They are never ſeen in the day, but fly all night: in ſome parts they are called the lightning-bug.

The *ſpider* is here a poiſonous inſect, which hurts by ſtinging. Of theſe there are many ſpecies, but the moſt remarkable is the *mountain-ſpider*, which is ſeldom found any where but in the woods, near the mountains. Several ſorts of theſe ſpiders make their webs ſo ſtrong, that they often entangle ſmall birds; thoſe perſons who have the misfortune to be ſtung by one, are afflicted with different diſorders, according to the nature of the ſpider that communicated the poiſon. Some have violent pains at the heart; others ſhortneſs of breath: others trembling, cold-ſweats, and vomiting; others laughing, ſinging, with a number of other ſymptoms that frequently end in death.

The birds of *Carolina* are much the ſame as in *Virginia*.

Among the fiſh are ſeveral ſpecies of the whale, the *porpoiſe*, the *ſword-fiſh*, the *ſhark*, the *pilot-fiſh*, the *devil-fiſh*, ſo called from its having a large pair of horns, and being of a monſtrous ſize and ſtrength, the *boneto*, the *drum-fiſh*, of which there are two ſpecies, *rock-fiſh*, *mullets*, *plaice*, *ſoals*, *ſhad*, *ſkate*, *thornbacks*, *eels* of ſeveral ſorts, *ſmelts*, *herrings*, *ſturgeon*, *trout*, *gudgeons*, *perch*, *carp*, *dace*, &c. with many ſorts of ſhell-fiſh.

INHABITANTS, *their Manners and Cuſtoms*.

THE deſcendants of the *Europeans* in *Carolina* are a ſtraight, tall, well-limbed, and active people, whoſe children are ſeldom troubled with rickets, or with the many other diſtempers with which the *Europeans* are afflicted. The men who frequent the woods, and labour out of doors, have a brown complexion; but the women, who do not expoſe themſelves to the weather, are frequently very fair and well featured; they have bright ſparkling eyes, and are as finely ſhaped as any women in the world. Red-haired people of either ſex are ſeldom met with in this country.

The women generally marry very young, ſome at thirteen or fourteen, and thoſe that continue unmarried till they are twenty, are reckoned old maids, which is here a very opprobrious epithet. The women are very fruitful, moſt of the houſes having a number of ſmall children. The women ſeldom miſcarry, and have very eaſy labours.

The children at nine months old are generally able to run about: they are remarkably prompt and docile. The girls are not only bred to the needle and ſpinning, but to the dairy and domeſtic affairs, which many of them, whilſt very young, conduct with great propriety. Both ſexes are very dexterous in the management of the canoe, to which they are trained from their infancy.

The planters, from the richneſs of the ſoil, live in the moſt eaſy and pleaſant manner; and are ſeldom heard to repine at any misfortune except the loſs of their friends, there being here a copious ſupply of all the neceſſaries of life. Poverty is here an entire ſtranger: the planters, who live well, are the moſt hoſpitable people poſſible to all ſtrangers, to thoſe who by any misfortune have loſt the uſe of their limbs, or become unable to work; to ſuch objects the ſtate allows fifty pounds a year for their ſupport, ſo that there are no beggars or vagabonds in the country.

The men are very ingenious in building their canoes and houſes; but, for the moſt part, live in an indolent and luxurious manner, which introduces many diſeaſes.

The eſtabliſhed religion is that of the church of *England*; beſide which there are *Preſbyterians*, *Baptiſts*, and *Roman Catholics*; liberty of conſcience being fully allowed.

Their houſes are built after two different manners: the moſt ſubſtantial planters generally uſe brick, and lime made of oyſter-ſhells, there being no ſtone fit for that purpoſe at a diſtance from the mountains. The meaner ſort erect theirs with timber, and the outſide with clapboards. The roofs of both ſorts of houſes are covered with ſhingles. They have generally ſaſh-windows, and large decent rooms, with good cloſets.

The principal diverſions are *fiſhing*, *fowling*, and *hunting* wild beaſts. They are very fond of *horſe-racing*, which is performed in a very odd manner; for near each town, and in many parts of the country, they have what they call race-paths, which ſeldom exceed a quarter of a mile in length, and only two horſes ſtart at a time. They are alſo very fond of gaming, eſpecially with cards and dice, at which they play very high. They greatly admire cock-fighting. They are alſo very fond of dancing.

The produce of this country for exportation to *Europe* and the iſlands are, *rice*, *indigo*, *pitch*, *tar*, *turpentine*, *roſin*, *tobacco*, *peas*, *beef*, *pork*, *tallow*, *hides*, *deer-ſkins*, *furs*, *cotton*, *horſes*, *wheat*, Indian *corn*, *potatoes*, *honey*, *bees-wax*, *myrtle-wax*, ſeveral ſorts of *gums*, *ſnake-root*, *maſts* for ſhips, *planks*, and *boards* of moſt ſorts of timber.

Indigo, a dye obtained from a plant of the ſame name, which was probably ſo called from *India*, where it was firſt cultivated, and from whence, for a conſiderable time, the whole of what was conſumed in *Europe* was brought. This plant, when grown, reſembles the fern, and when young is ſcarcely diſtinguiſhable from lucern graſs. Indigo is generally planted after the firſt rains which ſucceed the vernal equinox: the ſeed is put into the ground in ſmall ſtraight trenches, about eighteen or twenty inches aſunder, and is fit for cutting the beginning of July. It cuts again toward the end of Auguſt, and if a mild autumn ſucceeds there is a third cutting at *Michaelmas*. The indigo land muſt be weeded every day, and the plants cleanſed from worms. Each acre yields ſixty or ſeventy pounds weight of indigo, which at a medium is worth fifty pounds.

The indigo when cut is firſt laid in a vat about twelve or fourteen feet long, and four deep, to the height of about fourteen inches, to macerate and digeſt. Then this veſſel, which is called the ſteeper, is filled with water: the whole having lain about twelve or ſixteen hours, according to the weather, begins to ferment, ſwell, riſe, and grow inſenſibly warm; at this time ſpars of wood are run acroſs to prevent its riſing too much, and a pin is then ſet to mark the higheſt point of its aſcent; when it falls below this mark they judge that the fermentation has attained its due pitch, and begins to abate; upon which the manager turns a cock, and lets off the water into another vat, which is called the beater; and the groſs matter that remains in the firſt vat is carried off to manure the ground.

When the water, ſtrongly impregnated with the particles of indigo, has run into the ſecond vat, they agitate it till it heats, froths, ferments, and riſes above the rim of the veſſel in which it is contained: to allay this violent fermentation oil is thrown in as the froth riſes, which cauſes it to ſubſide inſtantly. When this beating has continued twenty, thirty, or thirty-five minutes, a ſmall muddy grain begins to be formed; for the ſalts and other particles of the plant before diſſolved in the water are now re-united, and begin to granulate. When this is completed, they let in ſome lime-water from an adjacent veſſel, gently ſtirring the whole. The indigo now granulates more fully, the liquor aſſumes a purpliſh colour, and the whole is troubled and muddy; it is now ſuffered to ſettle; then the clearer part is permitted to run off into a ſucceſſion of veſſels, from whence the water is conveyed away as faſt as it clears at the top, till nothing remains but a thick mud, which is put into bags of coarſe linen. Theſe are hung up and left for ſome time, till the moiſture is drained off, and to finiſh the drying, this mud is turned out of the bags, and worked upon boards of a porous timber with a wooden ſpatula. It is alſo frequently expoſed to the morning and evening ſun, but only for a ſhort time, and then put into boxes or frames, where it is again expoſed to the ſun in the ſame cautious manner, till with great labour and attention the operation is finiſhed, and that valuable drug called indigo fitted for the market. The greateſt ſkill and care is required in every part of the proceſs, without which there is great danger of ſpoiling the whole.

In all parts of *Carolina*, but eſpecially in *North Carolina*, the people make great quantities of *turpentine*, *roſin*, *tar*, and *pitch*, which are all produced from the pine. Turpentine is drawn by merely cutting inciſions in the tree, forming ſeveral channels which meet at the bottom in a point, where a receiver is placed. Theſe channels are cut as high as a perſon can reach with an ax, and the bark is peeled off from thoſe parts of the trunk which are expoſed to the ſun, that its heat may the more effectually promote the exudation, which flows into the receiver. This turpentine being boiled in kettles becomes roſin.

Tar is made by preparing a circular floor of clay, declining toward the centre, from which is laid ſloping a wooden pipe, which reaches about ten feet without the circumference. Under the end of the pipe the earth is dug away, and barrels placed to receive the tar as it runs. Upon the floor is built a pile of dry pine-wood ſplit in pieces, and ſurrounded with a wall of earth, or clay, which covers it all over, except a little at the top, where the fire is at firſt kindled. When the fire begins to burn they cover this opening likewiſe, to prevent there being any flame, and to leave only ſufficient heat to force the tar downward into the pipe in the centre of the floor. The heat they temper as they pleaſe, by thruſting a ſtick through the earth and letting in the air in as many places as they think proper. *Pitch* is made by boiling tar in large iron-kettles ſet in furnaces, or by burning it in round clay-holes made in the earth.

DIVISIONS *and* TOWNS.

THIS ſtate, as we have already obſerved, is divided into *North* and *South Carolina*; the former extends about three hundred miles along the ſea-coaſt, and is ſeparated from *South Carolina* by an imaginary line drawn in the 34°. N. latitude, from the *Atlantic* ocean to the *Apalachian* mountains. It is ſubdivided into fourteen townſhips. The principal rivers are *Ronoac*, or *Albemarle* river, the river *Neuſe*, and *Clarendon* river, upon which are ſeated the principal towns in the province, namely, *Wilmington* on *Clarendon* river, which is the largeſt town in the ſtate, and has much the greateſt trade; *Neuborn* on the *Neuſe*, and *Edenton* on the river *Albemarle*; at which three places the general aſſembly of *North Carolina* ſit alternately; but the planters being diſperſed over the country, none of theſe towns are worth mentioning.

The bounds of *South Carolina* are much reduced from their original extent, *Georgia* being taken off to the ſouthward, as far as the river *Savanna*, which runs in a curve round the S. and W. part of the ſtate out of *North Carolina*. Its extent upon the *Atlantic* ocean to the E. is upward of a hundred miles, and W. from the ſea upward of two hundred. There is no doubt but the ſilk-worm might be bred here to great advantage, the mulberry tree, its natural food, abounding in this country; indeed ſome attempts that way have been made not without ſucceſs.

The only town in either of the *Carolinas* worthy of notice is CHARLES TOWN, one of the fineſt in *North America* for ſize, beauty, and trade. This is the metropolis of *South Carolina*: it is ſeated between two navigable rivers, *Aſhley* on the W. and S. and *Cowper* river on the E. in 32°. 30′. N. latitude. The ſtreets are wide and ſtraight, interſecting each other at right angles; thoſe running E. and W. extend about a mile from one river to the other. Its harbour is good in every reſpect but that of a bar, which hinders veſſels of more than two hundred tons burden from entering. The town is regularly and pretty ſtrongly fortified by art and nature. Here are two very handſome churches built with brick, beſide ſeveral other edifices for public worſhip, belonging to different ſects of diſſenters. Near the centre of the town is a neat market-houſe, and at a ſmall diſtance is the ſtate-houſe, a handſome and commodious brick building. In the neighbourhood of the town are convenient barracks ſufficient for a thouſand men. *Charles Town* contains about a thouſand dwelling-houſes, four thouſand male inhabitants, and ſix thouſand negro ſlaves. Several handſome equipages are kept here; for the planters and merchants are rich and well bred, the people expenſive in their dreſs and way of living, and every thing conſpires to render this one of the livelieſt and politeſt places in *North America*; but great part of the town was burnt down on the twenty-firſt of February, 1741, by which much valuable merchandize was entirely deſtroyed. It has alſo frequently ſuffered by inundations and unhealthy ſeaſons.

At the breaking out of the *American* war in 1776, *Charles Town* was attacked by a ſquadron of ſhips commanded by Sir *Peter Parker*, and a body of land forces under general *Clinton*. The ſhips attacked the fort which commands the entrance of the harbour, but not being at all ſeconded by the army which had been landed, they were obliged to retire with great loſs, after a very obſtinate conteſt; but it was taken by *Sir Henry Clinton* and *Admiral Arbuthnot*, on the 12th of May, 1780.

The town of BEAUFORT is ſeated on the iſland of *Port Royal*, on the borders of *Georgia*, in 31° 40′. N. latitude, and an hundred miles S. of *Charles Town*; the iſland and continent forming a fine capacious harbour of ſuch depth, that it is capable of containing the whole royal navy of *England*. The iſland on which the town is ſeated, conſiſts of near a thouſand acres, and is navigable all round for boats and periaguas, and one half of it for ſhipping, where large veſſels may load and unload from the ſhore.

The number of inhabitants in the whole province of *South Carolina* amounts to about ſixty thouſand whites, and above double that number of blacks.

The roads are as good as in moſt parts of the world, and travelling as pleaſant, they being made broad and convenient for all ſorts of carriages, as coaches, chaiſes, waggons, and carts, eſpecially for horſemen, the lands generally lying level, and the beautiful and delightful proſpects affording a high entertainment to the traveller.

There are a great number of negro ſlaves born in the country, who prove more induſtrious and tractable than thoſe brought from the coaſt of *Africa*: at leaſt being born in ſlavery, they have never imbibed that love of liberty which is apt to make men reſtive and ſtubborn under the galling yoke of oppreſſion. "I have frequently ſeen them whipped (ſays our author) to that degree, that large pieces of their ſkin have been hanging down their backs; yet I never obſerved one of them ſhed a tear, which plainly ſhews them to be a people of very harſh and ſtubborn diſpoſitions:" but might he not rather ſay, that it ſhews them to be poſſeſſed of invincible courage and magnanimity? The laws againſt theſe unhappy beings of our own ſpecies are extremely rigorous; ſo that if a negro cut or give the ſlighteſt wound to his maſter, or any other Chriſtian, with an unlawful weapon, as a ſword, ſcymeter, or even a knife, and there is blood ſhed, if it be known among the planters, they immediately meet and order him to be hanged, which is always performed by another negro; and generally the planters bring moſt of their blacks with them to behold their fellow negro die; and it is not even in the power of the maſter to ſave him. Indeed he ſuffers nothing by the loſs of his ſlave, for the province is obliged to pay him the full value of what the unhappy wretch is judged to be worth.

Several blacks born in the country can read and write; others are bred to trades, and prove good artiſts; and others are very induſtrious in improving the plantations, planting rice, corn, and tobacco, and making vaſt quantities of turpentine, tar, and pitch, they being better able to undergo fatigues, in the ſultry heats of ſummer, than the *Europeans*.

HISTORY *of* CAROLINA.

THE extenſive territory of the two *Carolinas* and *Georgia*, are a part of the diſcovery made by *Cabot* in 1497; but no ſettlement having been made by the *Engliſh* in conſequence of this diſcovery, the *Spaniards*, in 1512, attempted one; but not ſucceeding, abandoned the country, which lay neglected by *Europeans*. *Chattillon*, the celebrated leader of the Proteſtants in *France*, who was not only a great admiral, but an able ſtateſman, procured two veſſels to be fitted out for diſcoveries upon that coaſt; probably intending to retire thither, with thoſe of his perſuaſion, ſhould his meritorious endeavours to preſerve their liberties fail. Theſe ſhips ſailed in the year 1562, under the command of M. *Ribaut*, and in two months arrived on the coaſt of *Florida*, as all this country was then called, from its abounding in flowers.

Ribaut landed in ſeveral places to the N. of *Altamaha* river, taking poſſeſſion of the country in the name of his maſter, and calling it *Carolina* in honour of his ſovereign *Charles* IX. He at laſt ſettled at the mouth of *Albemarle* river, and giving the *Indians* to underſtand, in the beſt manner he was able, that he and thoſe that were with him were all enemies to the *Spaniards*, this ſecured them a friendly reception, and the good offices of the inhabitants; and he there erected a fort, to which he gave the name of *Charles-fort*. But ſoon after a civil war breaking out in *France*, he was obliged, from the want of ſupplies, to abandon the ſettlement; and had he not been ſo happy as to meet with an *Engliſh* ſhip from which he procured proviſion, both he and his people would probably have periſhed by famine.

The admiral, not diſcouraged, was ſo well ſatisfied with the account they gave him of the country, that in 1564 he fitted out five or ſix ſhips, in order to make another attempt to ſettle a colony. This was accordingly done at the place of their landing in the firſt expedition. The *Spaniards*, who had intelligence of their proceedings, diſpatched a conſiderable force to attack the colony, who, not ſatisfied with reducing it, barbarouſly put all the people to the ſword after having promiſed them quarter. Not content with this they committed great outrages upon the natives, by both which they paved the way for the vengeance that ſoon after fell upon them for theſe unneceſſary and unprovoked acts of cruelty: for notwithſtanding the admiral and his party were by this time deſtroyed by the dreadful maſſacre of *St. Bartholomew*, and though the deſign of a colony died with him, one M. *de Gorgues*, a private gentleman, fitted out ſome ſhips, and ſailed to that coaſt merely to revenge the murder of his countrymen and friends. The *Indians* gladly embraced the opportunity of joining in the puniſhment of the common enemy. The *French* and theſe their allies had laid ſiege to two or three forts the *Spaniards* had erected there, took them, and, without mercy, put the whole garriſon in each to the ſword. The adventurers, ſatisfied with this action, returned, and the *French* court, blinded by their bigotry, did not then underſtand the advantages that might have been obtained from giving *America* to the Proteſtants. Had they taken this ſtep, *Great Britain* might probably have had either no ſettlements in *America*, or they muſt have been ſmall in extent, and precarious in their tenure.

After the *French* expedition, *Carolina* remained unnoticed by the *Spaniards*, *French*, and *Engliſh*, till Sir *Walter Raleigh* projected an eſtabliſhment there, which was afterward fixed in *Virginia*; and it was not till the year 1663 that any ſettled reſolution was taken for fixing a colony here. In that year the earl of *Clarendon*, lord high chancellor of *England*, the duke of *Albemarle*, the lord *Craven*, the lord *Berkeley*, lord *Aſhley*, afterward earl of *Shafteſbury*, ſir *George Carteret*, ſir *Willam Berkeley*, and ſir *George Colleton*, obtained a charter from *Charles* II. for the property and juriſdiction of that country from 31°. latitude to 36°. N. and being inveſted with full power to ſettle and govern the country, they had the model of a conſtitution framed, and a body of fundamental laws compiled, by the celebrated Mr. *Locke*.

On this plan the lords proprietors themſelves ſtood in the place of the king, and gave their aſſent or diſſent, as they thought proper, to all laws; appointed all officers, and beſtowed all titles of dignity; and each lord in turn acted for the reſt. In the province they appointed two other branches, which in a great meaſure reſembled the legiſlature in *England*. They conſtituted three claſſes of nobility: the loweſt compoſed of thoſe to whom they had made grants of twelve thouſand acres of land, whom they ſtyled barons: the next order had twenty-four thouſand acres, or two baronies, with the title of caſſiques,

ſiques, who were to anſwer our earls; the third had two caſſiqueſhips, or forty-eight thouſand acres, and were called landgraves, a title analogous to a duke. This body formed the upper houſe. The lower houſe was formed, as in the other colonies, of repreſentatives from the ſeveral counties and towns, and the whole was called not an aſſembly, but a parliament.

Charles Town was firſt built, and, as a general toleration for all religious perſuaſions was eſtabliſhed, through the humane diſpoſition of that excellent man who formed the model of their government, great numbers, who were haraſſed by perſecutions in *England* at that time, left their native country, and ſettled here. It was not long, however, before contentions broke out between thoſe profeſſing the principles of the church of *England*, and the different ſects of diſſenters, which materially impeded the advancement of the colony. The people alſo fell into diſputes with the lords proprietors, and, provoking the *Indians* by a ſeries of unjuſt and violent actions, gave occaſion to two wars, in which, however, they were victorious, and ſubdued almoſt all the *Indian* nations within their own bounds on this ſide the *Apalachian mountains*.

Theſe inteſtine diſtractions and wars kept the colony ſo low, that an act of parliament was made to prevent the ruinous conſequences of theſe diviſions, by putting the province under the immediate care of the crown, and the lords proprietors accepted a recompence of about twenty-four thouſand pounds, both for the property and juriſdiction; except earl *Granville*, who kept his eighth part of the property, which comprehended nearly the half of *North Carolina*, on that part which borders on *Virginia*. Their form of government, where it differed from that of the other colonies, was altered; and the country, for the more commodious adminiſtration of affairs, was divided into two diſtinct independent governments, called *North* and *South Carolina*. This event took place in the year 1728. Soon after, a firm peace being eſtabliſhed with all the neighbouring *Indian* nations; the province began to breathe, and obtain ſtrength; its trade advanced from that time with a rapid progreſs.

GEORGIA.

This colony, now a ſtate, received its name from his late majeſty *George* II. It lies to the ſouthward of *Carolina*, from which it is ſeparated on the N. by the river *Savannah*; it has the *Atlantic-ocean* on the E. the river of *St. John*, which divides it from *Eaſt Florida*, on the S. and on the W. it is bounded by *Louiſiana*.

The like inconveniences as thoſe felt in *Carolina* from heat, thunder, and lightning, are experienced in *Georgia*, that province lying ſtill more to the ſouthward. The planters ſometimes have their timber and houſes deſtroyed thereby, and their ſlaves and cattle killed.

The land lying low near the coaſt is woody, but at the diſtance of twenty-five miles begins to riſe into hills, which at length terminate in the *Apalachian* or *Aleghany-mountains*. From the foot of theſe mountains to the coaſt the country is level. The river *Savannah* is of ſuch a length, that canoes may ſail up it ſix hundred miles, and boats half that way. The coaſt of *Georgia* is defended from the fury of the *Atlantic-ocean* by being lined all along with a range of iſlands, and both theſe and the continent being thick ſet with trees, render the intermediate channel very pleaſant. About ſeventy miles from the ſhore of *Georgia* are ſand-banks, and the water ſhoaling gradually till within ſix miles of land, the banks become ſo ſhallow as to be impaſſable, except in the channels between the bars, which were formerly thought a ſufficient ſecurity from any attempts of an enemy's fleet, till the *Spaniards* paſſed theſe channels in 1742, and landed in the iſland of *St. Simon*, which would have inevitably fallen into their hands, had it not been reſcued by general *Oglethorpe*.

After paſſing the bars, ſhips find a ſecure and commodious harbour in the mouth of the river *Savannah*, and S. of it is a ſtill more capacious road, named *Tekyſund*, where a large fleet may ride in between ten and fourteen fathoms water, being land-locked, and having ſafe entrance over the bar.

This province abounds in cattle, and with a multitude of wild beaſts, birds, and poiſonous reptiles, which are in general the ſame as in *Carolina*.

Rice is ſaid to grow here rather better than in *Carolina*, which, with corn and *Indigo*, may be eſteemed its principal commodities. They have made ſome attempts toward cultivating the vine; and great expectations have been long raiſed of their producing large quantities of ſilk: this was one of the principal views of the truſtees at the firſt ſettlement of this province; indeed both theſe branches may hereafter become conſiderable, the climate and ſoil being proper for them, as hath been ſufficiently proved by a variety of experiments.

The principal town in *Georgia* is SAVANNAH, the capital, ſeated in 31°. 58′. N. latitude. The houſes and warehouſes are built at a diſtance from each other, to prevent the ſpreading of fire, and form ſeveral ſpacious ſquares and wide ſtreets. The town is extremely well ſituated for trade, as the navigation of the river *Savannah* on which it ſtands, and from which it takes its name, is very ſecure, and ſhips of three hundred tons burden may lie within ſix yards of the town, where the worm does not eat into them. In the town is a church, a meeting-houſe, a wharf, and ſome other public buildings; and near it the orphan-houſe, founded by Mr. *Whitfield*, which is converted into a college for the education of young men for the miniſtry.

On the 29th day of December 1778, the town of *Savannah* was taken by colonel *Campbell*, at the head of the 71ſt regiment of foot, two battalions of *Heſſians*, and a detachment of the royal artillery, eſcorted from *New York* by two men of war under the command of commodore *Parker*. In September following, the count *d'Eſtaing*, with twenty ſail of the line, two fifty gun ſhips, and eleven frigates, appeared off the coaſt, and landed 4000 land-forces, thirteen miles from *Savannah*, which were joined by a body of *Americans* under general *Lincoln*. General *Prevoſt*, who commanded at *Savannah*, was ſummoned to ſurrender the town to the *French* king; he deſired twenty-four hours to deliberate on an anſwer; which being granted, he employed that time in putting every thing in the beſt poſture of defence. On the 9th of October the *French* and *Americans* attacked the lines; but, after ſeveral hours obſtinate conteſt, they were driven back, with the loſs of about 1600 men killed or wounded; among the latter was the count *d'Eſtaing*. Soon after this repulſe the *French* troops were re-embarked, and the enterprize abandoned.

About four miles within land from the river are the villages of *Highgate* and *Hampſtead*, which lie about a mile diſtant from each other. The inhabitants apply themſelves chiefly to gardening, and ſupply the town of *Savannah* with greens and roots.

Two hundred miles farther up the river, which is navigable ſo far for large boats, is AUGUSTA; which ſtands upon a ſpot of ground of great fertility, and is ſo commodiouſly ſeated for the *Indian* trade, that from the firſt eſtabliſhment of the colony it has been in a very flouriſhing condition, and very early maintained ſix hundred whites in the trade only: for their trade with the *Creeks*, the *Chickeſaws*, and the *Cherokees*, is very conſiderable for ſkins; they alſo deal with them for a few furs; but theſe are of an inferior ſort.

The inhabitants of this province, who are a mixture of epiſcopalians and diſſenters, amount at preſent to about eight thouſand whites, and twenty thouſand negroes.

HISTORY *of* GEORGIA.

THE province of GEORGIA was divided from *South Carolina*, and a ſettlement begun there in 1732, in conſequence of a repreſentation made to his late majeſty *George* II. by ſeveral patriotic noblemen and gentlemen, who obſerving that a conſiderable number of people in theſe kingdoms were, by a variety of misfortunes, rendered incapable of ſubſiſting in ſuch a way as to be uſeful to themſelves and the community, formed the deſign of ſettling that part of *America* which conſtituted the *Engliſh* frontier toward the *Spaniards* and *French*; and though within the bounds of the province of *South Carolina*, was in reality no part of it, as not being at all ſettled, and therefore rather a burden than an advantage to the province to which it belonged. They therefore applied to the crown for ſufficient power to ſet this undertaking on foot, and meeting with all the encouragement they could wiſh, eaſily obtained a very extenſive charter. Their next care was to raiſe a fund ſufficient to ſend over a conſiderable number of people, and provide them with all kinds of neceſſaries, toward which they ſubſcribed liberally themſelves, obtained conſiderable ſums by way of collection, and had a grant from parliament of ten thouſand pounds.

In forming the plan of this frontier ſettlement, it was reſolved to conſider each ſettler in the double capacity of a planter and a ſoldier, and not only to provide him tools for the cultivation of the land, but arms for defence, and to have him taught the uſe of both. It was alſo reſolved, that upon the firſt ſettling of the colony, towns ſhould be laid out, and lands allotted to each man for the ſupport of himſelf and his family, as near thoſe towns as poſſible. Every lot of land was to conſiſt of fifty acres. The uſe of negroes was prohibited as abſolutely inconſiſtent with the deſign of forming a frontier colony, and in many reſpects both inconvenient and dangerous.

Having made theſe diſpoſitions, it was reſolved to ſend over a hundred and fourteen perſons, men, women, and children, out of ſuch as were in low circumſtances, and on that account unable to follow any buſineſs in *England*, and who, if in debt, had leave from their creditors to go; and of ſuch as were recommended by the miniſter, church-wardens, and overſeers of their reſpective pariſhes; and *James Oglethorpe*, eſq. one of the truſtees, generouſly offered to go and form the ſettlement at his own expence. The truſtees prepared a form of government, and eſtabliſhed under their ſeal a court of judicature for trying cauſes, as well criminal as civil, in the town of *Savannah*, the name given to the firſt town to be raiſed: they alſo appointed a bailiff, a recorder, two conſtables, and two tythingmen, out of ſuch of the ſettlers as appeared moſt diſcreet and prudent.

Mr. *Oglethorpe* arrived at *Carolina* on the fifteenth of January 1733. That gentleman choſe a pleaſant, convenient, and healthful ſpot ten miles up the *Savannah* river, where the town was formed. The chiefs of the *Lower Creek Indians* came to treat of an alliance with the new colony, whom Mr. *Oglethorpe* received in one of the new houſes, and in the moſt amicable and friendly manner concluded a treaty of alliance and trade with them.

This treaty being concluded, Mr. *Oglethorpe* returned to *England*, taking with him ſeveral of the *Indian* chiefs and principal warriors.

Things being thus ſettled, two embarkations were made the ſame year, chiefly of *Saltzburghers*, who, with others that went before, built and ſettled a town called *Ebenezer*, upon the river *Savannah*. The next year the colony of *South Carolina*, ſending over a memorial relating their danger from the *French* and *Spaniards*, the parliament granted the truſtees an extraordinary ſupply of twenty-ſix thouſand pounds, and very conſiderable benefactions were made both in *Great Britain* and *Carolina*; on which account great numbers of people were ſent, chiefly conſiſting of perſecuted *German* proteſtants, and others from the N. of *Scotland*.

Some *Highlanders* arrived here in 1735, and ſettled on the river *Alatamahar*, about ſixteen miles from the iſland of *St. Simon*, which is ſeated at the mouth of that river, and there built a town called *Darien*, which name they afterward changed to that of *New Inverneſs*.

On the ſixth of February following arrived four hundred and ſeventy perſons, under the direction of Mr. *Oglethorpe*, who were ſettled upon the iſland of *St. Simon*, which is about forty miles in extent, has a rich and fruitful ſoil, and is full of oak and hickery-trees, intermixed with meadows. The *Creek Indians* upon this occaſion came down, and claiming a right to the land, were treated with and prevailed upon to agree, that the *Engliſh* ſhould poſſeſs it, and all the adjacent iſlands; which ſtep being taken, the *Engliſh* built there the town of *Frederica*, ſo called from prince *Frederic*, his preſent majeſty's father. And this being then the ſouthern barrier, a regular fortreſs was built there, ſtrengthened with four baſtions, and a ſtrong battery; other fortifications were alſo raiſed in different places. The colony now became ſo conſiderable as to excite the jealouſy of the *Spaniards*. However, the governor of *St. Auguſtine* entered into an amicable convention with Mr. *Oglethorpe* and the *Engliſh* colony, which treaty the *Spaniſh* miniſtry diſapproved, and prepared to attack *Georgia*; on which a regiment of ſix hundred men was ſent over for the defence and protection of the place, and as an encouragement to theſe ſoldiers, the truſtees allowed each man five acres of land, and after being ſeven years in the ſervice, he ſhould be entitled to his diſcharge, and a grant of twenty acres.

In the beginning of the year 1737, the parliament granted the truſtees twenty thouſand pounds more for the farther ſettling and ſecuring the colony, on which the truſtees made another embarkation of perſecuted *German* proteſtants, and all the towns which had been laid out in *Georgia* received great ſupplies.

At length a ſpirit of diſcontent almoſt generally prevailed; they quarrelled with one another and with their magiſtrates; they complained; they remonſtrated; but obtained no ſatiſfaction; many of them left *Georgia*, and diſperſed themſelves among the other colonies; ſo that of above two thouſand people, who had been carried thither at a great expence from *Europe*, it is ſaid, that not above ſeven or eight hundred were to be found in this province in a ſhort time after: upon which the truſtees, in 1752, ſurrendered their charter to the crown, and the government took the country under its own care; annulled all the particular regulations that had been made; allowed the people the unlimited uſe of negroes, with the importation of rum, and left *Georgia* exactly on the ſame footing with *Carolina*; ſince which time it has been gradually, but ſlowly, increaſing in the number of its inhabitants.

Toward the cloſe of the year 1775, *Georgia* acceded to the *American* confederacy, and ſent five deputies to aſſiſt at the general congreſs; whereupon the name of "the thirteen united colonies" was aſſumed. It is now an independent ſtate, and ſends three repreſentatives and two ſenators to the congreſs of the united ſtates.

The MISSISSIPPI, MISAURIS, *and* OHIO *Rivers*.

THE vaſt river MISSISIPPI is ſuppoſed to take its riſe from three or four ſprings, which unite at about 46°. N. latitude, and 98°. W. longitude, it has been aſcended as high as 45°. N. about 150 miles above the *Falls* of *St. Anthony*. Its courſe extends about three thouſand miles, compriſing its continual flexions. It proceeds in a S. E. direction, till it arrives at about 38°. N. latitude, and then proceeds almoſt due S. till it arrives at *Weſt Florida*, where it again runs to the S. E. and diſcharges itſelf into the gulf of *Mexico*.

It receives the river *St. Peter*, on the weſtward, near the *Falls* of *St. Anthony*, and the *Moingona* in the ſame direction, about 41°. N. latitude; from the eaſtward the *Fox* river; and the *Illinois* below 40°. A little lower, the noble *Miſauris* runs into it from the weſtward; the *Ohio* joins it from the eaſtward, about 37°. N. latitude; at 33°. the *White* river and the *Paniaſſas* firſt join, and then pour their united ſtreams into this grand receptacle of waters, which diſcharges itſelf into the ſea by a great number of openings, moſt of which have but little depth of water.

The *Miſſiſſippi*, after being joined by the *Miſauris*, is about ſix miles wide, and continues its courſe ſoutherly, no conſiderable ſtream falling into it after this, for between two and three hundred miles, when it is joined by the *Ohio*. The country on each ſide the *Miſſiſſippi* to this place is exceedingly fine, the climate warm and agreeable.

The navigation of the *Miſſiſſippi* is very tedious even in deſcending, as it is not deemed ſafe to ſail down it during the night; the river being conſtantly encumbered with floating trees, which the winds tear from its banks, and precipitate into the water. The aſcent is ſtill more difficult and tedious. Proceeding northward from its mouth, the adjacent country is one continued level ſpot, covered with vaſt foreſts of trees, which ſo entirely intercept the winds, as to cauſe a dead calm conſtantly to prevail, ſo that in this part it commonly takes a month to ſail only twenty leagues. When theſe foreſts ceaſe, the remainder of the navigation is obſtructed by ſtrong currents, ſo that boats ſeldom advance farther than five or ſix leagues in a whole day.

The OHIO, or *Fair River*, which Mr. *Jefferſon* calls "the moſt beautiful river upon earth," riſes in ſeveral branches, ſome of which ſpring near lake *Erie*, and others within a few miles of *Lake Ontario*. It is called the *Alleghaney* until it is joined by the *Monongahela*, which riſes from the W. ſide of the *Alleghaney* mountains in a great number of ſmall ſtreams, that unite, and together with the *Alleghaney* form this river, about 40. 35′. N. latitude, when it takes the name of *Ohio*. Its general courſe afterward inclines to the S. W. and takes a remarkably winding ſerpentine form. At *Fort Pit*, where the junction is made, it is a mile wide, but grows much wider before it joins the *Miſſiſſippi*, receiving ſeveral ſtreams in its courſe thither.

The country between the lakes and the junction of the *Ohio* and *Miſſiſſippi* for ſeveral hundred miles, and all the country between *Fort St. Joſeph* and the *Green-bay*, and between *Detroit* and the *Illinois*, and even much farther N. than *Detroit*, is level, and has an excellent ſoil; the climate is healthy and agreeable, and the winters ſhort and moderate: its natural productions are numerous and valuable: it is well ſtocked, but not encumbered with timber trees, which are tall, beautiful, and fit for all kinds of building; and no country in the world is capable of nobler improvements.

Great part of this country is now ſettled, and new ſtates are forming; one called *Kentuckey*, ſends repreſentatives and ſenators to congreſs.

Below the river *Ohio* on the E. ſide of the *Miſſiſſippi*, down to its mouth, the country is poſſeſſed for near two hundred miles to the eaſtward by the *Chickaſaws*, a numerous and powerful nation. This country is indeed ſandy, and inferior to that juſt deſcribed; but it produces rice and indigo in great perfection.

The *Cherokees* dwell at the S. W. end of the *Apalachian* mountains, from the head of the river *Taneſee*, which flows into the *Ohio* about a hundred miles before its confluence with the *Miſſiſſippi*. Their country extends in length about four hundred miles from the N. E. to the S. W. and is about two hundred miles wide. It is very mountainous and difficult of acceſs every way. The *Cherokees* live in as good order as any *Indians* on the continent, building their houſes with wood, and covering them with clay mixed with ſtraw, in ſuch manner as to render them cloſe, warm, and comfortable. They have many ſmall towns, diſperſed among the mountains, on the branches of the rivers *Taneſee* and *Savannah*. They have great plenty of horſes, ſome black cattle, and many ſwine. Theſe people raiſe much corn, and fence in their fields, which is practiſed by no other *Indians*. They have alſo orchards of peach-trees, and keep poultry. They attend to gardening; and are likewiſe very famous for hunting, their country abounding with deer, elks, and bears; and they have plenty of turkies in the vallies between the mountains.

The banks of the river TANESEE are entirely uninhabited below the mountains, as far as its confluence with the *Ohio*; yet the country is claimed by the *Chickaſaws*, a brave warlike people, who have only one town, which is ſeated on the S. of the *Taneſee*. Their town is picqueted in, and defended by a fort. Their houſes are built in much the ſame form as thoſe of the *Chickaſaws*. Theſe people raiſe a great deal of corn, have ſome black cattle and ſwine, and a conſiderable number of horſes; but can only raiſe five hundred fighting men.

To the S. W. of the *Cherokees* live the *Creek Indians*, who are ſeated partly between them, the *Chickaſaws*, and *Georgia*, in a level country. They can raiſe about two thouſand fighting men, and live in the ſame manner, and have the ſame commodities, as the *Cherokees* and *Chickaſaws*. All the country of the *Greeks* is infeſted with alligators and ſnakes of a very large ſize; and, at certain ſeaſons of the year, they are much plagued with muſketoes.

The iſle of NEW ORLEANS is a very beautiful and fertile ſpot, and the town of that name is very populous. The inhabitants in the whole province are ſaid to amount to an hundred thouſand perſons. The negroes are alſo very numerous; the ſoil toward the S. is proper for producing rice, tobacco, and indigo; and toward the N. for raiſing wheat.

SECT. IV.

The Poſſeſſions lately acquired by the SPANIARDS *on the Continent of* North America.

FLORIDA, *Weſt and Eaſt.*

THIS country was firſt viſited by the *French*, in the year 1562; who were excited to this enterprize by that great ſtateſman, admiral *Coligny*, under whoſe influence a colony was formed, which was ſoon extirpated by a force ſent out from *Spain* by *Philip* II. who laid claim to the country. This cruelty was retaliated by *Dominic de Gourgues*, a native of *Gaſcony*, but little or no attention was paid to ſettling the country, by either nation, for a long courſe of years.

It is bounded on the N. by *Georgia*, and the country extending to the *Miſſiſſippi*; which river is its weſtern limit; and it forms that part of the gulf of *Mexico* which lies eaſtward of that river. On the E. it has the *Atlantic Ocean*; but to the S. E. the *Bahama* iſlands are ſeparated from it by a channel of about ſeventy miles in breadth. This country was ceded to *Great Britain* by the twentieth article of the treaty of 1763, in conſequence of *Cuba* being reſtored to *Spain*. It was divided into Eaſt and Weſt; on the former a ſettlement was made at *Penſacola*, (lat. 30°. 18′. longitude 87°. 30′. W.) and on the latter the town of *St. Auguſtine*, (latitude 29°. 34′. N. longitude 81°. 35′. W.) was peopled with additional numbers. The kindly nature of the climate and the ſoil induced the *Britiſh* legiſlature to cheriſh this infant colony with liberal ſupport, but the change of affairs on the *American* continent cauſed this country to be ceded to *Spain* by the fifth article of the treaty in 1783. *Weſt Florida* is a narrow ſlip of land, extending along a conſiderable part of the northern boundary of the gulf of *Mexico*; *Eaſt Florida*, which is of moſt conſiderable extent, conſiſts of a broad peninſula, ſtretching nearly from N. to S. and terminating at 25°. N. latitude.

LOUISIANA.

LOUISIANA was, till lately, conſidered as a much more extenſive country than it is at preſent; M. *de Liſle* extending it on the N. to *Canada*; on the E. to the province of *New York*, *Pennſylvania*, *Virginia*, *Carolina*, and *Georgia*; on the S. to the *Gulf of Mexico*; and on the W. to *Mexico*, or *New Spain*, and unknown countries inhabited by *Indians*. But by the ſeventh article of the treaty of peace at *Paris* in 1763, a great part of this country, containing all on the E. ſide the river *Miſſiſſippi*, was ceded to *Great Britain*, except the town of *New Orleans*, and the iſland on which it is ſituated.

By a ſpecial act, ratified at *Fontainbleau* in the year 1765, his moſt Chriſtian Majeſty ceded to the Catholic King, his heirs and ſucceſſors for ever, the whole country known by the name of *Louiſiana*, together with *New Orleans*, and the iſland on which that city is ſituated.

The country, at preſent named *Louiſiana*, extends from 29°. to 45°. N. latitude, and from about 89°. to 105°. W. longitude from *London*. The ſoil is very indifferent near the mouth of the *Miſſiſſippi*; but the country contains a great deal of excellent land, well ſtocked with a variety of trees, planted by the hand of nature; the ſoil on the S. is adapted to the cultivation of indigo, cotton, tobacco, and rice, and the N. to that of wheat.

The Isle *of* Orleans, at the mouth of the *Miſſiſſippi*, in 29°. 58′. latitude, and 89°. 59′. W. longitude from *Greenwich*, is a very beautiful and fertile ſpot of ground, on which the *French* had a conſiderable city, named *New Orleans*, which is the capital, and indeed the only city of *Louiſiana*. It is fortified in a regular manner, and, according to ſome *French* authors, has about ſix hundred handſome houſes, and five pariſh churches; with ſtraight and handſome ſtreets, that croſs each other at right angles: but the buildings are chiefly of wood, and not remarkable for their beauty.

This town owed its riſe to the deluſions which were practiſed by the celebrated projector *Law* upon the *French* nation. The immenſe wealth which was ſuppoſed to be contained in the mines of *St. Barbe*, in *Louiſiana*, cauſed a company to be formed in *France*, and a national phrenzy long prevailing, vaſt numbers embarked for the purpoſe of ſettling on the banks of the *Miſſiſſippi*. They were landed at *Biloxi*, in *Weſt Florida*, where the far greater number periſhed by want and diſappointment. Five years after, the ſurvivors were removed to the iſland on which the town of *New Orleans* was built, and ſo named after the regent of *France*. The Abbé *Raynal* aſſerts that upward of a million ſterling was ſunk in this diſaſtrous ſcheme. *Hiſt. Politique, liv.* XVI.

The *Spaniards* have many other territories very rich and extenſive, on the northern diviſion of the continent of *America*, of which they were the firſt diſcoverers, and afterward the conquerors; but of theſe we ſhall not treat at preſent, deſigning to make the continental poſſeſſions of *Spain*, both to the N. and S. the ſubject of one connected hiſtory, under a diſtinct head; and ſhall therefore now proceed to deſcribe the Iſlands of the *Weſt Indies*.

CHAP. III.

The ISLANDS in the WEST INDIES.

Introduction. *Of the firſt Diſcovery of the* Weſt Indies.

MANKIND owe the diſcovery of the weſtern world to the gold, the ſilver, the precious ſtones, the ſpices, ſilks, and coſtly manufactures, of the Eaſt; and even theſe incentives were, for a conſiderable time, inſufficient to prompt to the undertaking, although the moſt ſkilful navigator of the age proffered to riſk his life in the attempt.

That wonderful property communicated to the needle by the loadſtone, which conſtitutes its polarity, had been diſcovered about an hundred and ſeventy years before any navigator was found hardy enough to croſs the equinoctial line, and the *Portugueſe* were the firſt to achieve it. The property of the *loadſtone*, or *magnet*, to attract iron, was well known to the ancients, and appears to have excited their aſtoniſhment. *Cicero* ſpeaks of it as ſuch an incredible fact, as could not be believed if it was not demonſtrably proved, (*de Divinatione, lib.* I. *ſect.* 39.) *Lucretius* likewiſe ſpeaks of this wonderful magnetic quality, and *Pliny*, the naturaliſt, employs a whole chapter on this ſtone, called by the ancients *magnes*, which chapter he introduces by ſaying, "what can be more wonderful! or in what part of Nature is there any thing more improbable!" *Hiſt. Nat. lib.* XXXVI. *cap.* 16. But to what an height would the wonder of the ancients have been raiſed, could they have had the foreknowledge, that, in future times, another property ſhould be found in this operative ſubſtance, by which an inſtrument would be obtained capable of directing daring morals, through oceans of an inconceivable extent, and of giving them acceſs to every part of the globe! "The compaſs," to adopt the words of an able writer, "may be ſaid to have opened to man the dominion of the ſea, and to have put him in full poſſeſſion of the earth, by enabling him to viſit every part of it." *Flavio Gioia*, a citizen of *Amalfi*, a town of conſiderable trade in the kingdom of *Naples*, was the author of this great diſcovery, about the year 1302. It hath often been the fate of thoſe illuſtrious benefactors of mankind, who have enriched ſcience and improved the arts by their inventions, to derive more reputation than benefit from the happy efforts of their genius: but the lot of *Gioia* has been ſtill more cruel: through the inattention or ignorance of contemporary hiſtorians, he has been defrauded even of the fame to which he had ſuch a juſt title. We receive from them no information with reſpect to his profeſſion, his character, the preciſe time when he made this important diſcovery, and the accidents and enquiries which led to it: the knowledge of this event, though productive of greater effects than any recorded in the annals of the human race, is tranſmitted to us without any of thoſe circumſtances which can gratify the curioſity which it naturally awakened." *Robertſon's Hiſtory of America*, I. 36. *Collenas & Trombellus de Acut nauticæ Inventore, Inſtit. Acad. Bonon, tom.* II. *pars* III. p. 372.

Chriſtopher Columbus, who was deſtined to the high honour of revealing a new hemiſphere to *Europeans*, was by birth a *Genoeſe*, who had been early trained to a ſeafaring life, and, having acquired every branch of knowledge connected with that profeſſion, was no leſs diſtinguiſhed by his ſkill and abilities, than for his intrepid and perſevering ſpirit. This man, when about forty years of age, had formed the great idea of reaching the *Eaſt Indies* by ſailing weſtward; but, as his fortune was very ſmall, and the attempt required very effectual patronage, deſirous that his native country ſhould profit by his ſucceſs, he laid his plan before the ſenate of *Genoa*, but the ſcheme appearing chimerical, it was rejected. He then repaired to the court of *Portugal*; and although the *Portugueſe* were at that time diſtinguiſhed for their commercial ſpirit, and *John* II. who then reigned, was a diſcerning and enterpriſing prince, yet the prepoſſeſſions of the great men in his court, to whom the matter was referred, cauſed *Columbus* finally to fail in his attempt there alſo. He next applied to *Ferdinand* and *Iſabella*, king and queen of *Arragon* and *Caſtile*, and at the ſame time ſent his brother *Bartholomew* (who followed the ſame profeſſion, and who was well qualified to fill the immediate place under ſuch a leader) to *England*, to lay the propoſal before *Henry* VII. which likewiſe, very fortunately for the future well being of the country, met with no ſucceſs.

West Longitude from London.

Church Yard, & C. Stalker, Stationers Court.

ceſs. Many were the years which *Chriſtopher Columbus* ſpent in ineffectual attendance at the *Caſtillian* court; the impoveriſhed ſtate into which the finances of the united kingdoms were reduced, by the war with *Granada*, repreſſing every diſpoſition to attempt great deſigns; but the war being at length terminated, the powerful mind of *Iſabella* broke through all obſtacles; ſhe declared herſelf the patroneſs of *Columbus*, whilſt her huſband *Ferdinand*, declining to partake as an adventurer in the voyage, only gave it the ſanction of his name. Thus did the ſuperior genius of a woman effect the diſcovery of one half of the globe!

The ſhips ſent on this important ſearch were only three in number, two of them very ſmall: they had ninety men on board. Although the expenſe of the expedition had long remained the ſole obſtacle to its being undertaken, yet, when every thing was provided, the coſt did not amount to more than 4000 *l.* and there were twelve months proviſions put on board.

Columbus ſet ſail from port *Palos*, in the province of *Andaluſia*, on the 3d of Auguſt 1492: he proceeded to the *Canary* iſlands, and from thence directed his courſe due W. in the latitude of about 28°. N. In this courſe he continued for two months, without falling in with any land; which cauſed ſuch a ſpirit of diſcontent and mutiny to riſe as the ſuperior addreſs and management of the commander became unequal to repreſs, although for theſe qualities he was eminently diſtinguiſhed. He was at length reduced to the neceſſity of entering into a ſolemn engagement to abandon the enterpriſe, and return home, if land did not appear in three days. Probably he would not have been able to reſtrain his people ſo long from acts of violence and outrage, in purſuing ſo untried and dreary a courſe, had they not been ſenſible that their ſafety in returning home, depended very much on his ſkill as a navigator, in conducting the veſſels.

At length the appearance of land changed their deſpondency to the moſt exulting rapture. It was an iſland, abounding with inhabitants, both ſexes of which were quite naked; their manners kind, gentle, and unſuſpecting. *Columbus* named it *San Salvador*; it is one of the cluſter which bears the general name of *Bahama*; it was only 3°. 30′. latitude to the S. of the iſland of *Gomora*, one of the *Canaries* from whence he took his departure. This navigator was ſtill ſo confirmed in the opinion which he had formed before he undertook the voyage, that he believed himſelf to be then upon an iſland which was ſituated adjacent to the *Indies*. Proceeding to the S. he ſaw three other iſlands, which he named *St. Mary of the Conception*, *Fernandina*, and *Iſabella*. At length he arrived at a very large iſland, and as he had taken ſeven of the natives of *San Salvador* on board, he learned from them that it was called *Cuba*, but he gave it the name of *Juanna*. He next proceeded to an iſland which he called *Eſpagnola*, in honour of the kingdom by which he was employed, and it ſtill bears the name of *Hiſpaniola*. Here he built a fort and formed a ſmall ſettlement. He then returned home, having on board ſome of the natives, whom he had taken from the different iſlands: ſteering a more ſouthern courſe, he fell in with ſome of the *Caribbee* iſlands; and arrived at the port of *Palos* on the 15th of March 1493, having been ſeven months and eleven days on this moſt important voyage.

On his arrival, letters patent were iſſued by the king and queen confirming to *Columbus* and to his heirs all the privileges contained in a capitulation which had been executed before his departure, and his family was ennobled.

Not only the *Spaniards*, but the other nations of *Europe*, ſeem to have adopted the opinion of *Columbus*, in conſidering the countries which he had diſcovered as a part of *India*. Whence *Ferdinand* and *Iſabella* gave them the name of "*Indies*," in the ratification of their former agreement with *Columbus*. Even after the error was detected, the name was retained, and the appellation of "*Weſt Indies*" is now given by all *Europe* to this country, and that of *Indians* to the inhabitants. That the *Eaſt Indies* might be reached by a weſtern courſe was proved not long after by *Magellan*, the only error therefore imputable to *Columbus*, is his ſuppoſing them ſo near to *Europe*, in that direction, which implies that he had no accurate idea of the circumference of the globe; as ſuch an opinion was founded entirely on its ſpherical form. It is indeed remarkable, how many of the conjectures which have been made, and opinions formed, by the moſt intelligent and enlightened of mankind, in all ages, reſpecting the globe, have been found to be erroneous when experiment has ſubſtituted fact for opinion. A ſtriking inſtance is in the ſuppoſed exiſtence of a *terra auſtralis incognita*, which, when inveſtigated by Capt. *Cook*, vaniſhed like the baſeleſs fabric of a viſion. The opinion of a northern paſſage to the *Eaſt Indies*, whether by an eaſtern, or a weſtern courſe, was no leſs believed, and is now, no leſs confuted; for although it ſeems highly probable that no land lies in the high northern latitudes, yet a barrier, equally impenetrable, is formed by the immenſe expanſe of ice which ever occupies the polar regions: but to return.

Nothing could poſſibly tend more effectually to rouſe every active principle in human nature, than the diſcoveries which *Columbus* had made; no time was therefore loſt, nor expence ſpared, in preparing a fleet of ſhips, with which this great man ſhould reviſit the countries he had made known. Seventeen ſhips were got ready in ſix months, and fifteen hundred perſons embarked on board them, among whom were many of noble families, and who had filled honourable ſtations. Theſe engaged in the enterpriſe from the expectation that the new diſcovered country was either the *Cipango* of *Marco Paulo*, or the *Ophir*, from which *Solomon* obtained his gold and precious merchandize.

Ferdinand, now deſirous of ſecuring what before he had been unwilling to venture for the obtaining, applied to the pope to be inveſted with a right in theſe new-diſcovered countries, as well as to all future diſcoveries in that direction; but as it was neceſſary that there ſhould be ſome ſavour of religion in the buſineſs, he founded his plea on a deſire of converting the ſavage natives to the *Romiſh* faith. *Alexander* VI. who then filled the papal chair, it ought to be premiſed, was the moſt profligate and abandoned of men: being a native of *Arragon*, and deſirous of conciliating the favour of *Ferdinand*, for the purpoſe of aggrandizing his family, he readily granted a requeſt which, at no expenſe or riſk, tended to extend the conſequence and authority of the papacy: he therefore beſtowed on *Ferdinand* and *Iſabella*, "all the countries inhabited by infidels, which they had diſcovered, or ſhould diſcover;" but as it was neceſſary to prevent this grant from interfering with one not long before made to the crown of *Portugal*, he appointed that a line, ſuppoſed to be drawn from pole to pole, one hundred leagues to the weſtward of the *Azores*, ſhould ſerve as a limit between them; and in the plenitude of his power, conferred all to the E. of this imaginary line upon the *Portugueſe*, and all to the W. of it upon the *Spaniards*.

Columbus ſet ſail on his ſecond voyage from the port of *Cadiz*, on the 25th of September 1493; when he arrived at *Eſpagniola*, he had the affliction to find that all the *Spaniards* whom he had left there, amounting to thirty-ſix in number, had been put to death by the natives, in revenge for the inſults and outrages which they had committed. After having traced out the plan of a town, in a large plain, near a ſpacious bay, and given it the name of *Iſabella*, in honour of his patroneſs the queen of *Caſtile*, and appointed his brother, *Don Diego*, to preſide as deputy governor in his abſence, *Columbus*, on the 24th of *April* 1494, ſailed, with one ſhip and two ſmall barks, to make farther diſcoveries in thoſe ſeas. In this voyage he was employed five months, and fell in with many ſmall iſlands on the coaſt of *Cuba*, but with nothing of any importance except the iſland of *Jamaica*.

Soon after his return to *Hiſpaniola*, he reſolved to make war upon the *Indians*, who, according to the *Spaniſh* hiſtorians, amounted to 100,000 men; theſe having experienced every lawleſs act of violence from their invaders, were rendered extremely inveterate, and thirſted for revenge; a diſpoſition which appears to have been foreign to their natures. Having collected his full force, he attacked them by night, whilſt they were aſſembled

bled in a wide plain, and obtained a moſt deciſive victory, without the loſs of one man on his part. Beſide the effect of canon and fire arms, the noiſe of which was appaling, and their effect, againſt a numerous body of *Indians*, cloſely drawn together, in the higheſt degree deſtructive, *Columbus* had brought over with him a ſmall body of cavalry. The *Indians*, who had never before ſeen ſuch a creature, imagined the *Spaniſh* horſes to be rational beings, and that each with its rider formed but one animal: they were aſtoniſhed at their ſpeed, and conſidered their impetuoſity and ſtrength as irreſiſtible. In this onſet they had beſide another formidable enemy to terrify and deſtroy them: a great number of the largeſt and fierceſt ſpecies of dogs which were then bred in *Europe*, had been brought hither, which, ſet on by their maſters, ruſhed upon the *Indians* with the fierceneſs of ſavage beaſts, and wherever they came, the miſerable natives threw down their weapons, without attempting reſiſtance, and fled with all the ſpeed which terror could excite. Numbers were ſlain, and more made priſoners, who were indiſcriminately conſigned to ſlavery. *Dr. Robertſon* ſays, upon the authority of a M. S. in his poſſeſſion, that five hundred of theſe captives were ſent (or rather brought by *Columbus*) to *Spain*, and ſold publicly in *Seville* as ſlaves. *Hiſtory of America*, *vol.* I. *note* XX. p. 440.

The character of *Columbus* ſtands very high in the eſtimation of mankind; he is venerated not only as a man poſſeſſing ſuperior fortitude, and ſuch a ſteady perſeverance, as no impediments, dangers, or ſufferings, could ſhake, but as equally diſtinguiſhed for piety and virtue. His ſecond ſon *Ferdinand*, who wrote the life of his father, apologizes for this ſeverity toward the natives, on account of the diſtreſſed ſtate into which the colony was brought: the change of climate, and the indiſpenſable labours which were required of men unaccuſtomed to any exertions, had ſwept away great numbers of the new ſettlers, and the ſurvivors were declining daily, whilſt ſuch was the irreconcilable enmity of the natives, that the moſt kind and circumſpect conduct on the part of the *Spaniards*, would not have been effectual to regain their good will. This apology ſeems to have been generally admitted, for all modern writers have beſtowed upon the diſcoverer of the new world the warmeſt commendation unmixed with cenſure. It is an unpleaſant taſk to derogate from exalted merit, and to impute a deliberate plan of cruelty and extirpation to a man revered for moral worth; but although a pert affectation of novel opinions can only originate in weak minds, and can be countenanced only by ſuch, yet a free and unreſerved ſcrutiny into *facts*, can alone ſeparate truth from error, and apportion the juſt and intrinſic degree of merit belonging to any character. That *Columbus* had formed a deſign of waging offenſive war againſt the *Indians*, and reducing them to ſlavery, before he entered upon his ſecond voyage, and, conſequently, before he was apprized of the deſtruction of the people which he had left upon the iſland of *Hiſpaniola*, may be inferred from his providing himſelf with ſuch a number of fierce and powerful dogs. Having found the natives peaceable and well diſpoſed, he had no reaſon to apprehend that they would commence unprovoked hoſtilities; the cavalry which he took over, whilſt it tended to impreſs thoſe people with the deepeſt awe and veneration, was fully ſufficient for the ſecurity of the new colony, if the friendſhip of the natives had been ſincerely meant to be cultivated by a kind and equitable deportment; but to treat them as a free people was inconſiſtent with the views which led to planting a colony, for as the grand incentive to undertake theſe diſtant voyages was the hope of acquiring gold, ſo, as *Columbus* had ſeen ſome worn as ornaments by the natives, and had been informed that the mountainous parts of the country yielded that precious metal, he had excited expectations in his employers, and in the nation at large, which both his intereſt and ambition compelled him as far as poſſible to realize: the *Spaniards* could not obtain gold without the aſſiſtance of the natives, and thoſe were ſo conſtitutionally indolent that no allurements of preſents or gratifications could excite them to labour. To reſcue himſelf therefore from diſgrace, and to ſecure future ſupport, he ſeems deliberately to have devoted a harmleſs race of men to ſlaughter or ſlavery. Such as ſurvived the maſſacre of that dreadful day, and preſerved their freedom, fled into the mountainous and inacceſſible parts of the iſland, which not yielding them ſufficient means of ſubſiſtence, they were compelled to obtain a portion of food from their cruel purſuers, by procuring gold duſt, in order to ſupport life; a tribute being impoſed upon them which was rigourouſly exacted. Theſe wretched remains of a free people, thus driven from fruitfulneſs and amenity; compelled to labour for the ſupport of life; a prey to deſpondency, which the recollection of their former happineſs ſharpened, and which their hopeleſs ſituation rendered inſupportable, died in great numbers, the innocent, but unrevenged victims of *European* avarice. Such are the facts which have ever been admitted, yet, ſtrange contradiction! *Columbus* is celebrated for his humanity and goodneſs! but ſhould he not rather be conſidered as a moſt conſummate diſſembler; profeſſing moderation whilſt he meditated ſubverſion? and, like moſt of the heroes and conquerors whom hiſtory records, renouncing every principle of juſtice and humanity when they ſtopped the career of his ambition? *Ferdinand Columbus*, his ſon and biographer, has with great addreſs covered the ſhame of his father, whilſt the admiring world has been little diſpoſed to cenſure a man, the ſplendor of whoſe actions ſo powerfully faſcinates and dazzles.

When *Columbus* returned to *Spain* from his ſecond voyage, he found that his enemies had been very active and ſucceſsful in exciting in *Ferdinand* and *Iſabella* unfavourable ſentiments of his conduct; but he ſo far recovered his credit that a ſquadron of ſix ſhips was fitted out, with which he proceeded on a third voyage, on the 30th of May 1498. Taking a more ſouthern courſe, he diſcovered the iſland of *Trinidad*, on the coaſt of *Guiana*, near the mouth of the great river *Oronoko*. The ſwell occaſioned by this vaſt river pouring its waters into the ocean was ſo great, as to expoſe the ſhips to extreme danger, but after long combating the currents and tremendous waves with doubtful ſucceſs he conducted his ſquadron ſafe through a narrow ſtrait, which ſeparates that iſland from the continent; this he called "*Bocca del Drago*," the dragon's mouth. He juſtly concluded, that ſuch a vaſt body of water muſt flow through a country of immenſe extent, and that he was now arrived at that continent which it had long been the object of his wiſhes to diſcover. Full of that idea he ſtood to the W. along the coaſt of thoſe provinces now known by the names of *Paria* and *Comana*. He landed in ſeveral places, and had ſome intercourſe with the natives, who reſembled thoſe of *Hiſpaniola* in their appearance and manner of life. "Thus" ſays *Dr. Robertſon*, "*Columbus* had not only the glory of diſcovering to mankind the exiſtence of a new world, but made conſiderable progreſs toward a perfect knowledge of it, and was the firſt man who conducted the *Spaniards* to that vaſt continent which has been the chief ſeat of their empire, and the ſource of their treaſures in that quarter of the globe." *Hiſtory of America*, I. p. 140.

He afterward directed his courſe to *Hiſpaniola*, and on quitting the continental coaſt fell in with the ſmall iſland of *Cubagua*, and the larger one called *Margarita*, not far diſtant: theſe afterward became remarkable for their pearl fiſhery.

The enemies of *Columbus* having at length deſtroyed all his credit with *Ferdinand* and *Iſabella*, *Francis de Bovadilla*, a knight of *Calatravia*, was appointed to repair to *Hiſpaniola*, with full powers to enquire into his conduct. This commiſſion *Bovadilla* exerciſed in the moſt arbitrary and ſevere manner; for, without having recourſe even to the form of a judicial enquiry, he diveſted *Columbus* of all authority, and, putting him in chains, ſent him a priſoner to *Spain*: but the authority thus exerciſed was not long held; he was ſuperſeded, and the government given to *Ovando*, who however proved, in the ſequel, to be but little leſs inimical to *Columbus*. Although this violent conduct was not approved by the king and queen, who endeavoured, by outward marks of attention and reſpect, to wipe off the ignominy which had been caſt upon the the diſcoverer of *America*, yet it is probable he would never have prevailed upon them, to aſſiſt him in the undertaking a fourth voyage, had it not been for the diſcovery made by the *Portugueſe*, of ſailing to the *Eaſt Indies* by doubling the *Cape of Good Hope*; but as it had ever been his firm belief, that the country which he had diſcovered was not far from the *Eaſt Indies*, and that there was a more direct way thither, by the route which he had ſtruck out, he prevailed upon his noble patrons to aſſiſt him in aſcertaining this important point: he had however only four ſmall barks aſſigned him; the largeſt not more than ſeventy tons burden. In this expedition he was accompanied by his brother *Don Bartholomew*, and his ſecond ſon *Don Ferdinand*, who afterward wrote his life.

He ſailed from *Cadiz* on the 9th of May 1502, but without being inveſted with any authority in the country which he had diſcovered. When he arrived at *Hiſpaniola*, he found *Ovando* little inclined to afford him aſſiſtance; he therefore ſoon quitted that iſland, and ſteering toward the continent, explored all the coaſt from *Cape Gracias a Dios* ſouthward, until he arrived at a harbour, which, on account of its beauty and ſecurity, he called *Porto Bello*. Whilſt thus coaſting he went aſhore at ſeveral places, and ſometimes proceeded up the country, but did not penetrate ſo far as to croſs the iſthmus which ſeparates the *Atlantic* from the *Pacific Ocean*. It was his deſign to have ſettled a colony to the W. of *Porto Bello*, but this ſcheme was ſo much diſreliſhed by his people that he could not effect it, and he was therefore deprived of the glory of planting the firſt colony on the continent of *America*. He afterward ſuffered many hardſhips, chiefly from the neglect of *Ovando*, and ſoon after his return to *Spain*, his great patroneſs *Iſabella*, queen of *Caſtile*, died; but this moſt able navigator did not long ſurvive her, he dying at *Valladolid*, on the 20th of May 1506, in the 59th year of his age.

SECT. I.

ISLANDS *belonging to* Great Britain.

The BERMUDAS, *or* SOMERS ISLANDS, *commonly called the* SUMMER ISLANDS.

THE *Bermudas*, or *Somers Iſlands*, which are diſtant about 300 leagues W. of the *Azores*, and equally diſtant from the continent of *America*, received their firſt name from being diſcovered by *John Bermudas*, a *Spaniard*, in the year 1527, after which they were frequently touched at by his countrymen in their paſſage to the *Weſt Indies*. They received their ſecond name from Sir *George Somers*, an *Engliſhman*, who was ſhipwrecked upon them, with Sir *Thomas Gates*, in 1609, in their paſſage to *Virginia*. The perpetual mildneſs of the climate has cauſed this name to be changed, by an apt alluſion, to *Summer Iſlands*. Theſe iſlands lie very cloſe to each other, and are very numerous, yet their whole circumference is not more than ſeven leagues, but moſt of them ſo ſmall and barren, as not to be habitable. They lie about 32°. 35′. N. latitude, and about 63°. 28′. W. longitude, from *Greenwich*. Their greateſt extent, which is from the N. E. to the S. W. is computed at about twenty miles, and their greateſt breadth about five: ſcarce an eighth part of this ſmall ſpot is inhabited. They are ſo environed with rugged and dreadful rocks, that they ſeem to threaten all the ſhips that venture near the coaſt with inevitable deſtruction; and ſo many have been wrecked upon them, that the *Spaniards* gave them the name of *Los Diabolos*, or the *Devils*.

The air of theſe iſlands has always been eſteemed extremely healthful; and the appearance of every thing in *St. George*'s iſland, and the other fertile ones, is perfectly delightful: whence people have been accuſtomed to remove thither from the other colonies, in order to repair their broken conſtitutions. The heat in ſummer is very ſupportable, and cold in winter is here unknown: ſome even affirm, that there is but one ſeaſon, and that a perpetual ſpring, in which the trees never loſe their verdure; for though the leaves at one time of the year fall off, others have firſt budded out: but, to abate the enjoyments to be derived from the excellence of the climate, theſe iſlands are ſubject to tremendous ſtorms of thunder and lightning. It is ſaid, that there is not a ſingle ſpring of freſh and good water on any one of the iſlands.

Maize is the only corn raiſed here. The *cedars* of theſe iſlands, are ſaid to exceed all thoſe of the other parts of *America*, particularly in their fragrancy, durableneſs, beauty, and the hardneſs of the wood; they grow here in ſuch abundance, that this wood anſwers in every reſpect the purpoſe of oak timber; for the inhabitants not only build their beſt ſloops, brigantines, and other veſſels with cedar, but ſome of their houſes, churches, and other public buildings. Their *palmeto*, which is a kind of wild palm, is no leſs uſeful and common. Its fruit, which in colour, ſhape, and ſize, reſembles our damſon, is very delicious; the wood is very ſerviceable not only for building but for fuel, and the leaves, which are generally between eight and ten feet long, ſerve to make a very good covering for their houſes. The *date*, or *palm-tree*, likewiſe yields a fine fruit; and their foreſts abound with a variety of odoriferous and medicinal woods, ſome black, others yellow, and ſome red. The berries of theſe laſt trees have the ſtyptic quality of a ſloe, and are much uſed by the *Engliſh* to cure the flux, which frequently enſues from eating the luſcious palm-berries, and other rich fruits. All *European* and *American* trees are ſaid to grow here in great perfection, eſpecially the *mulberry*, *olive*, *laurel*, *Barbary pear*, and *orange-trees*, which are peculiarly excellent; the fruit, in point of ſize, ſcent, and flavour, far exceed thoſe either in the *Eaſt* or *Weſt Indies*. They have alſo a very ſingular plant called the *Summer Iſland red-wood*, the berry of which is as red as the prickly-pear, and gives the ſame kind of tincture; it nouriſhes worms, which turn into flies that are ſomewhat larger than the cochineal fly, and have a medicinal virtue much exceeding it. They have alſo a plant called the *poiſonous weed*, that grows much in the ſame manner as ivy; but this is the only noxious vegetable in any of theſe iſlands.

There were no quadrupeds in the *Bermudas* but hogs, when Sir *George Somers* was ſhip-wrecked here; and theſe he found by ſending out two or three of his own to feed, which rambling home, a huge wild boar followed them, and being killed, was found excellent meat. The hogs they afterward killed were all black, whence it is concluded that the *Spaniards* left them there to breed, they being of the ſame kind with thoſe they carried to the continent of *America*. They have alſo all the other ſpecies of *European* cattle, but they are not very numerous.

Theſe iſlands abound with a prodigious variety of wild fowl. The *Engliſh* at their firſt coming found a kind of water-fowl peculiar to thoſe iſlands, called *cowkees*; they breed in the holes of the rocks, and in burrows like rabbits. This bird is of the ſize of a ſea-mew, and is of ſo gentle a nature as to be eaſily caught; and being very good food, ſuch numbers have been taken of them that they are now become ſcarce. Here are likewiſe found the *rumpted-bird* and the *pemlico*, the laſt of which is ſeldom ſeen in the day-time.

Among the inſects in theſe iſlands the *ſpider* is the only one deſerving particular mention, being ſaid to be larger here than in any other country in the world; and its colours are remarkably beautiful.

The number of theſe iſlands has not been aſcertained: the principal of them are *St. George*, *St. David*, *Ireland*, *Somerſet*, *Long-iſland*, *Bird-iſland*, *Cooper*, and *Nonſuch*. The firſt of theſe is the moſt conſiderable.

The *Bermudas* were never inhabited by any race of *Indians*; the firſt ſettlement which was made there was by the *Engliſh* in the year 1612; the new colony conſiſting of about ſixty perſons. The ſalubrity of the climate ſoon attracted many others; among whom was the firſt harmonizer of *Engliſh* verſe, *Waller*; who having been detected in forming a confederacy to oppoſe the violent meaſures of the republican parliament, ſaved his life by betraying his friends, and paying 10,000 *l.* when eſcaped, to ſecure himſelf from future imputation, he took a voyage to theſe iſlands; which he deſcribes in the higheſt ſtyle of panegyric. The following paſſage is the moſt cloſely deſcriptive of any part of the three cantos of which the poem conſiſts.

> The naked rocks are not unfruitful there,
> But, at ſome conſtant ſeaſons, ev'ry year
> Their barren tops with luſcious food abound,
> And with the eggs of various fowls are crown'd.
> Tobacco is the worſt of things, which they
> To Engliſh landlords, as their tribute, pay;
> Such is the mould, that the bleſt tenant feeds
> On precious fruits, and pays his rent in weeds.
> With candy'd plantains and the juicy pine,
> On choiceſt melons and ſweet grapes they dine,
> And with potatoes fat their wanton ſwine.
> Nature theſe cates with ſuch a laviſh hand
> Pours out among them, that our coarſer land
> Taſtes of that bounty, and does cloth return,
> Which not for warmth, but ornament, is worn.
> For the kind Spring which but ſalutes us here,
> Inhabits there, and courts them all the year,
> Ripe fruits and bloſſoms on the ſame trees live;
> At once they promiſe what at once they give.
> So ſweet the air, ſo moderate the clime,
> None ſickly lives, or dies before his time.
> Heav'n ſure has kept this ſpot uncurſt,
> To ſhew how all things were created firſt.
> The tardy plants in our cold orchards plac'd
> Reſerve their fruit for the next age's taſte;
> There a ſmall grain in ſome few months will be
> A firm, a lofty, and a ſpacious tree.
> The *palma-chriſti*, and the fair *papá*,
> Now but a ſeed (preventing Nature's law)
> In half the circle of the haſty year
> Project a ſhade, and lovely fruits do wear.
> And as their trees, in our dull region ſet,
> But faintly grow, and no perfection get,
> So, in this northern tract, our hoarſer throats
> Utter unripe and ill-conſtrained notes,
> While the ſupporter of the poets' ſtyle,
> *Phœbus*, on them eternally does ſmile.

The number of people in all the iſlands is computed at about five thouſand. The only manufacture carried on here is that of ſail cloth. They ſeem to content themſelves with the plenty and pleaſure of their country, and with enjoying a ſafe and quiet retreat from the troubles and cares of the reſt of the world. Indeed the inhabitants have conſtantly maintained an excellent reputation, and the *Bermudas* have been equally remarkable for the fineneſs of the country, and the integrity, ſimplicity, and honeſty of the people. Their beauty and healthfulneſs, together with the amiable character of the inhabitants, induced the learned dean *Berkeley*, afterward biſhop of *Cloyne*, to erect an academy at the *Bermudas* for promoting uſeful learning and true religion in the *Weſt Indies*; and the Society for the Propagation of the Goſpel aſſiſted him in procuring a patent from *George* I. for building a college here. That gentleman and three fellows of *Trinity-college Dublin*, with ſeveral of the doctor's relations, embarked on this undertaking; but were driven by a ſtorm to *Long-Iſland*, in the province of *New York*, from whence the doctor, with his companions, went to ſeveral other towns in *New England*, where they preached: he ſettled for ſome time on *Rhode Iſland*; but the deſign of erecting a college being laid aſide, they returned home, and ſoon after doctor *Berkeley* was promoted to the ſee of *Cloyne* in *Ireland*.

The cuſtom-houſe receipts at the port of *St. George*, in the year 1784, amounted to 273 *l.* ſterling, and the expences in ſalaries were 120 *l.* *Fifteenth Report of the Commiſſioners of the Public Accounts.*

The governor and council are appointed by the crown, and the repreſentatives of the people compoſe the aſſembly. The commerce of theſe iſlands chiefly conſiſts in timber and proviſions, in building ſhips, and ſending a ſmall quantity of tobacco to *England*.

The BAHAMA, *or* LUCAYAN *Iſlands.*

THE BAHAMA iſlands are ſeated at the E. and S.E. of *Florida*, and to the N. of *Cuba*, ſtretching from the N.W. to the S.E. between 21°. and 27°. N. latitude, and between 70°. and 80°. W. longitude. Theſe iſlands are very numerous; but there are only twelve worthy of notice. Between them and the continent of *Florida*, is the gulf of *Bahama* or *Florida*, through which the *Spaniſh* galleons ſail in their paſſage to *Europe*.

Great Bahama, from which the reſt of theſe iſlands take their name, is ſeated in 26°. 40′. N. latitude, at the diſtance of fifteen or twenty leagues from *Florida*, and eight or ten to the W. of the iſland of *Lucaya*, from which it is divided by a channel, which, notwithſtanding its great breadth, is very dangerous from its rocks and ſands. *Bahama* is about fifty miles in length; and ſcarce any where ſixteen miles in breadth, and in many places not half ſo broad. It is however very pleaſant and fruitful, the air ſerene and temperate, and the ſoil remarkably rich, the iſland being watered by a multitude of ſprings and brooks of freſh water. It formerly produced plenty of *guaiacum*, *ſaſſafras*, *ſarſaparilla*, and *red-wood*; but theſe were all deſtroyed by the *Spaniards*; ſo that its chief produce at preſent is *Indian* wheat: here are alſo ſeveral kinds of fowl, and a particular ſort of rabbit: the reſt of their proviſions and other neceſſaries the inhabitants obtain from *Carolina* and *Florida*. The people, both here and in the iſland of *Providence*, are capable of aſſiſting the ſhips that are driven upon their coaſt by the boiſterous winds and impetuous currents, which are very prevalent.

PROVIDENCE iſland is ſituated in the centre of ſome hundreds of theſe iſlands, ſome of them many miles in length, and others only ſmall rocks riſing above the water; ſo that it is extremely dangerous for ſhips to be driven in among them by a tempeſt. This iſland lies in 24°. 30′. N. latitude, and is about twenty-eight miles long and eleven broad, where it is wideſt. The iſland is beautiful, and abounds with *trees*, *plants*, *fowl*, and *fiſh*. The moſt conſiderable profit formerly made by the planters aroſe from the misfortunes of ſuch as were ſhipwrecked, and whom they relieved; or from thoſe who in a winter-voyage to the continent of *America* were driven to the *Bahama* iſlands, and put into *Providence* for proviſions, where the traders who purchaſed them from *Carolina* kept ſtore-houſes for the purpoſe. The principal produce of the iſland is *ſalt* and *braſiletto-wood*; they alſo ſow peaſe and *Indian* wheat.

The other iſlands, although they do not merit any particular notice, amount to between four and five hundred. The moſt conſiderable of them, are *Eluthera*, *Harbour-iſland*, *Lucaya*, *Androſs*, *Cigateo*, which may be termed of the ſecond magnitude. Thoſe of the third are *Cat-iſland*, the firſt land diſcovered by *Columbus* in *America*, and called by him *St. Sebaſtian*; the natives then called it *Guanabani*, *Yumeta*, *Samana*, *Mayaguana*, *Yuma* or *Exuma*, *Ynagua*, *Caicos*, and *Triangulo*. The reſt, they are rather barren rocks than iſlands.

The native *Indians*, a ſimple, harmleſs, inoffenſive people, received the firſt diſcoverers with the utmoſt aſtoniſhment, flocked in crowds to the *European* veſſels, and admired every thing they ſaw; but though they behaved in a moſt inoffenſive manner, the *Spaniards*, after *Columbus*'s time, not thinking thoſe iſlands worth making a ſettlement upon, to the diſgrace of humanity, extirpated all the natives they found, though they were very numerous; and thus wantonly murdered many thouſands of innocent perſons, without any advantage to themſelves.

Theſe iſlands lying out of the courſe of ſhips bound to the continent of *America*, it was long before they were known to the *Engliſh*: but in 1667 Captain *William Sayle*, in a voyage to *Carolina*, was forced among them in a ſtorm, and had an opportunity of examining them carefully, particularly a large iſland to which he at firſt gave his own name; but being a ſecond time driven upon it, he gave it the name of *Providence*.

On his return to *England*, he imparted to the proprietors of *Carolina*, a knowledge of the ſituation and circumſtances of theſe iſlands. *Charles* II. made a grant of the *Bahama* iſlands to *George* duke of *Albe-*

marle, *Anthony* lord *Aſhley*, *John* lord *Berkeley*, *William* lord *Craven*, ſir *George Carteret*, and ſir *Peter Colleton*.

The firſt governor ſent by the proprietors to *Providence-iſland* was Mr. *Chillingworth*, who ſailed thither about the year 1672, when ſeveral people from *England*, and the other colonies, went to ſettle there; but living a licentious life, and Mr. *Chillingworth* endeavouring to bring them to reaſon, they aſſembled in a tumultuous manner, and having ſeized him, ſhipped him off for *Jamaica*, and then lived without control.

The proprietors, ſome years after, ſent another governor to preſide over theſe turbulent ſettlers, but the *Spaniards* ſeized upon the iſland and diſpoſſeſſed the *Engliſh*. It then remained uninhabited for ſeveral years; until, about the time of the Revolution, ſeveral *Engliſh* from *Europe* and *America* removed thither, and the proprietors again exerciſed their right of appointing a governor.

About ten years after, *Providence* and the adjacent iſlands contained near a thouſand inhabitants; ſome tobacco was planted, a ſugar-mill was ſet up, and other improvements were made; but in 1708, the *Spaniards* and *French* landed, ſurpriſed the fort, took the governer priſoner, plundered and ſtripped the *Engliſh*, burnt the town of *Naſſau*, together with the church, ruined the fort, and ſpiked the guns: after which they carried off the governor, and the blacks.

The *Bahama Iſlands* at length becoming a receptacle for pirates, Captain *Woodes Rogers*, was appointed governor, who ſailed for *Providence* in 1718, with a naval force deſtined to ſubdue the pirates; which having effected, he began to regulate the government, and nominated ſix of the adventurers who came with him to be of the council, to which he added ſix out of ſuch of the inhabitants as had never been pirates. A few years after, the number of inhabitants was computed at fifteen hundred, out of whom were formed three companies of militia. The face of affairs being thus changed, the town of *Naſſau* was rebuilt, and plantations laid out. Soon after the neighbouring iſland of *Eleuthera* was likewiſe ſettled: about ſixty families fixing themſelves there, erected a ſmall fort for their defence. The like was done in *Harbour-iſland*, where the plantations ſoon grew more conſiderable, and a larger fort was built for the protection of the inhabitants. *Cat-Iſland* was alſo ſettled. Captain *Rogers* likewiſe defeated the *Spaniards*, who, after three ſeveral preparations, attacked him with two thouſand men; which force he repulſed, and burnt two of their ſhips of war in their retreat. At length Mr. *Rogers* returned to *England*, and was ſucceeded in his government by captain *Fitz-Williams*; and ever ſince this laſt ſettlement of theſe iſlands, they have been continually improving, though they advance but ſlowly.

In the year 1776, the iſland of *Providence* was invaded and deſpoiled, by a ſquadron of *American* ſhips conſiſting of five frigates. In the year 1782, the *Spaniards* took the iſland, which in the next year was retaken by Col. *Devereaux*; and by the 7th article of the peace which followed, his Catholic majeſty reſtored to *Great Britain* all the *Bahamas*.

The expences of the cuſtoms in the *Bahama* iſlands, in the year 1784, according to the fifteenth report of the commiſſioners appointed to examine the public accounts, was 201 *l.* ſterling, and the receipts on duties only 82 *l.*

JAMAICA.

THIS is one of the iſlands called the *Greater Antilles*, which, as diſtinguiſhed from the *Carribbee Iſlands*, contain only *Jamaica*, *Cuba*, *Hiſpaniola*, and *Porto Rico*, with ſome ſmall iſlands that are, geographically, appendant to them.

JAMAICA, the largeſt of all the *Britiſh Iſlands* in *America*, was named by *Columbus St. Jago*, which it retained while in the poſſeſſion of the *Spaniards*; but after being taken by the *Engliſh*, it obtained its ancient name. It extends from 75°. 20'. to 78°. W. longitude from *London*, and from 17°. 50'. to 18°. 42'. N. latitude; and is about a hundred and ſixty miles in its greateſt length from *Point Negril* on the W. to *Point Morant* on the E. and ſeventy in its greateſt breadth from the *Point* of *Portland* on the S. to *Gallina Point*, on the N. but grows leſs toward each end. It is twenty-four leagues S. of *Cuba*, and thirty W. of *Hiſpaniola*.

Being within the tropic, it has the trade wind continually on the S. ſide of the iſland, which is called the ſea-breeze. It begins to blow about eight o'clock in the morning, increaſes till twelve at noon, decreaſes as the ſun deſcends, and entirely ſubſides by four o'clock in the afternoon. The land breeze begins about eight in the evening, blowing four leagues into the ſea; it continues increaſing till twelve at night, and decreaſes again till four. Thus, as the land-wind blows at night, and the ſea-breeze during the day, no ſhips can come into port except in the day-time, nor go out but at break of day, or ſoon after.

The whole iſland is interſected by one continued ridge of hills, which runs from E. to W. through the middle of it, and are called the *Blue Mountains*, on each ſide of which are chains of leſſer mountains, which gradually ſink as they approach the ſhore. The mountainous part is very ſteep, and the higheſt hills on their N. and S. ſides are ſurrounded by very deep channels made by the violent rains, which almoſt every day fall on the mountains, and firſt wearing a ſmall channel for their paſſage, and afterward carrying every thing before them, form channels extremely deep. Moſt of the ſavannas, or plains, cleared of wood and fit for paſture, lie near the S. ſide of the iſland; they reſemble our meadow land, and a perſon may ride ſeveral miles without meeting with the leaſt aſcent: ſome of the plains within land are environed with hills. After rain they appear green and fertile; but after a long drought look yellow and parched.

The principal harbours in the iſland are *Port Royal* and *Kingſton*, which are fine and capacious; *Old Harbour*, *Carliſle* and *Montego Bays*, *Bluefields*; *Port Morant*, at the E. end of the iſland; and *Port Negril*, at the W. end: beſide which there are others on the S. and N. ſides; but it is dangerous approaching the coaſt without a pilot, on account of the coral rocks, with which it is every where encompaſſed.

None of the rivers of *Jamaica* are navigable; for, riſing in the mountains, in the centre of the iſland, they precipitate themſelves down the rocks to the N. and S. falling into the ſea before they have run many miles, frequently carrying down with them large trees and huge pieces of rock; ſeveral of them have cataracts fifty or ſixty feet high. In dry years, water is very ſcarce in the ſavannas at a diſtance from the rivers, ſo that many cattle die with driving to water. It is remarkable, that ſome of the rivers in the mountains in ſeveral places riſe above and ſink under ground, and in particular the *Rio d'Oro* falls and riſes two or three times. Another peculiarity is, that ſome of the ſprings and rivers petrify their channels by encruſting them with a cement which unites the gravel and ſand in their bottoms. There are alſo ſeveral hot ſprings, and many others that are ſalt and form lakes, particularly *Riotto*, a lake that receives much water, and has no viſible diſcharge. In theſe lakes, and in ponds formed by ſea-water, large quantities of ſalt is produced by the heat exhaling the moiſture.

The mountains, and indeed the greateſt part of the iſland, are covered with fine woods that never loſe their verdure, but look for ever green, and are gay in every ſeaſon. Nor are the beauties of the better cultivated vallies inferior to theſe; they too wear the verdant robe of nature, and pleaſe no leſs when they are laid out with the niceſt art and care, and produce the richeſt plants, as the *ſugar-cane*, *ginger*, *pimento*, and others. Here are likewiſe the fineſt *orange* and *lemon-trees* in great abundance. Fruit is ſo common that few regard it; on the way-ſides the *citron*, the *ſtar-apple*, the *guava*, and the *mamee*, grow wild. But theſe advantages are counterbalanced by many diſagreeable circumſtances: the rivers are infeſted by the dreadful *alligator*, the fens and marſhes nouriſh the *guana* and *galliwaſp*, with numberleſs ſnakes and noxious animals, and the ſcorching heat of a vertical ſun renders the iſland ſickly.

The longeſt day in ſummer is about thirteen hours, and the ſhorteſt in winter about eleven. At nine in the forenoon the air grows intolerably hot, and could ſcarce be endured, were it not for the ſea-breeze already mentioned. Indeed the hot and moiſt temperament of the air would ſoon bring on peſtilential diſeaſes, that would in a ſhort time convert the country to a deſert, had not the wiſe Contriver of all things prepared thoſe friendly gales, the ſea and land breezes, to temper the air and render it refreſhing.

The nights are ſometimes cool, and the dews are ſo copious within land, that in a morning the water drops from the leaves of the trees as if ſprinkled with rain. Theſe chilly and piercing dews, which fall every night after the pores have been opened by the extraordinary heat of the day, are found to be extremely unwholeſome; and ſtrangers who expoſe themſelves to their influence, ſeldom eſcape without a ſevere ſickneſs.

Inſtead of dividing the year into ſpring, ſummer, autumn, and winter, its only diviſions are the dry and wet ſeaſons: nor are theſe regular, but vary in many parts of the iſland. Thus about the *Blue Mountain* valley, and ſeveral hilly places, they have more or leſs rain every day in the year, and plant the ſugar-cane at the ſame time they are cutting others for uſe. On the N. ſide the ſeaſons are pretty regular; they begin to plant in Auguſt, and continue till Chriſtmas, all which time they are ſure of rain; after that, till the end of March, they have none; but then it begins again, and continues during the months of April and May. Several parts of the iſland, which were once the choiceſt and richeſt ſpots, and had fine ſugar-works, which uſed annually to produce many hundred hogſheads of that valuable commodity, are now only fit for grazing cattle, being dry for almoſt nine months in the year. This is aſcribed to the cutting down the woods; for the trees gathered and retained great quantities of vapours, which were diffuſed in rain. The months of July, Auguſt, and September, are called the hurricane months, becauſe they then happen moſt frequently.

It lightens almoſt every night, but attended with little thunder, which, whenever it happens, is very terrible; the claps being aſtoniſhingly loud, and the lightning in theſe violent ſtorms frequently does great execution. In February or March they expect earthquakes, which have ſometimes been as dreadful as any recorded in hiſtory; ſome of theſe we ſhall hereafter have occaſion to mention. Indeed, the inhabitants obſerve ſeveral days in the year in a ſolemn manner, on account of ſtorms and earthquakes.

According to the beſt obſervations, there is not one third of the country inhabited; there are indeed plantations round the iſland, but none at any great diſtance from the ſea; and even theſe are ſo far from being cultivated, that the greateſt part of the ground is not cleared, but is overgrown with wood; yet the ſoil is in ſome places ſo exceedingly fertile, that one acre has been known to yield ſeveral hogſheads of ſugar.

The Vegetables of JAMAICA, *with a particular Deſcription of the* Sugar-Plant, *its Culture and the Manner of making Sugar: the* Pimento-Tree, *the* Cocoa, *or* Chocolate-Tree, *the wild Cinnamon Coffee-Tree, and Ginger; with a conciſe Account of the* Beaſts, Birds, Inſects, *and* Fiſhes.

NO ſorts of *European* grain grow here; they have only maize, or *Indian* corn, *Guinea* corn, peaſe of various kinds, but none of them reſembling ours, with variety of roots. Fruits, as hath been already obſerved, grow in great plenty.

The *ſugar-plant* grows in a long ſtalk, or cane, divided by joints, two, three, four, or five inches aſunder, and about ſix feet high; the ſprouts and leaves at the top, riſing ſo as to make it near eight feet in all. The body of the cane ſeldom exceeds an inch in diameter; the colour of its tops is a pure graſs-green, but the cane itſelf when ripe, is yellowiſh. It is covered with a thin ſkin or bark, and within is of a white ſpongy ſubſtance full of juice, which the ſlaves and others ſuck; nothing being pleaſanter and more nouriſhing when it is ripe, and taken with moderation. Upon this occaſion they cut the rind, and put the ſpongy part into the mouth, when the juice will come more freely than honey out of the comb. This ſweetneſs is extremely agreeable, and far from being ſurfeiting. Of this juice are made *ſugar*, *rum*, and *molaſſes*.

The ſeaſon for planting ſugar-canes is from Auguſt to the beginning of December, and they do not arrive to maturity till they have been a year and a half in the ground. Their manner of growing is in ſprouts, three, four, or five, from one root. The cane-tops make very good food for horſes and black cattle; but the ſolid canes are carried to the mill.

They are planted by digging long trenches in the earth, about ſix inches deep, and as many broad, laying a double row of canes along in the trench, one by another, then the earth is thrown in, and another trench dug at about two feet diſtance, till all the land is planted by laying the canes along. Thus they produce the greateſt number of ſprouts; for this way a branch ſhoots out of every joint of the cane. The firſt planters uſed to thruſt a piece of cane perpendicularly into a hole, at certain diſtances, which yielded no ſhoot but from the top, and having three or four ſprouts whoſe whole weight depended on one root, when they grew tall and heavy, the ſtorms looſened the roots; but by this modern way of planting the root is ſecured, and the produce increaſed. They come up ſoon after they are planted, and in about twelve weeks they grow two feet high.

The next care of the planter is to weed the canes, and to dung them; but this laſt is done either when they are planted or when they are grown two feet high, and this is the greateſt trouble and expence the planter beſtows; for, but for this dunging, a third part of the negroes would execute every part of the buſineſs.

When the canes are ripe they are cut down, ſtripped of their leaves and tops, bundled up in faggots, and carried to the mill by mules, or in carts drawn by horſes. The mills are turned by oxen or horſes; and ſome ſubſtantial planters have erected wind-mills: there the juice is preſſed out by wooden rollers caſed with iron, and at the bottom of the mill is a hollow place which receives the juice, from whence it is conveyed by leaden pipes into a ciſtern near the boiling-houſe, where it muſt not remain above one day, leſt it ſhould grow ſour. From thence it is conveyed through a gutter, fixed to the walls of the boiling-houſe, to the clarifying copper, or boiler, and there boiled till all the groſs matter riſing to the top is ſkimmed off. It is then carried into a ſecond, and ſo into a third, fourth, fifth, ſixth, and ſeventh boiler; and is continually kept ſtirring and boiling till it comes to a conſiſtency; and yet all this boiling would only reduce it to a thick clammy ſubſtance; but to turn it to grain they pour in ſome lime-water, on which the ſugar begins to riſe up with a turbulent and ungovernable fury, occaſioned by the fermentation of the liquor from the lime-water and the vehement heat of the fire; when, to prevent its running over, they throw in a ſmall piece of tallow no larger than a nut, which ſoon cauſes it to fall. The liquor is at length emptied into a cooler, where it remains till it is fit to be potted. The pots are wide at the top, tapering downward, and a hole is left for the molaſſes to drain. In refining the ſugar, the firſt degree of pureneſs is permitting the molaſſes to drain away with the top of the pot open, by which means the air hardens the ſugar before it has time to refine by ſeparation. The ſecond degree is procured by covering the pots at the top with clay; the firſt requires but one month to refine, and the other four months.

We ſhall now deſcribe the principal trees, and ſhall begin with the *pimento*, which produces *Jamaica* pepper, or allſpice. It is as thick as a man's thigh, it riſes ſtraight above thirty feet, and is covered with a very ſmooth ſkin of a grey colour: it is branched out on every hand, having the end of its twigs ſet with leaves of ſeveral ſizes, the largeſt being four or five inches long, and two or three broad in the middle, whence it decreaſes in both extremes ending in a point. The ends of the twigs are branched into bunches of flowers, each ſtalk ſuſtaining a flower bending back, within which bend are many ſtamina of a pale green colour : theſe flowers have a branch of crowned berries, the crown being made up of four ſmall leaves, at firſt greeniſh ; but when ripe black, ſmooth, and ſhining, containing, in a moiſt green aromatic pulp, two large ſeeds, ſeparated by a membrane. This tree grows in all the hilly parts of the iſland ; but chiefly on the N. ſide. It flowers in June, July, and Auguſt, and the fruit ſoon ripens. There is no difficulty in curing the *Pimento*, or *Jamaica* pepper : they climb the trees, and pull the green unripe fruit, which they expoſe to the ſun till it becomes of a brown colour, and is fit for the market. According to Sir *Hans Sloane*, this is the beſt, the moſt temperate, mild, and innocent of all ſpices.

The body of the *cacao*, or *chocolate-nut-tree*, is commonly about four inches in diameter, and about twelve feet from the ground to the top of the tree ; the chocolate-nuts grow in pods, or long ſhells, each having three, four, or five kernels of about the ſize of cheſnuts, ſeparated from each other by a pleaſant refreſhing white ſubſtance, nearly of the conſiſtence of the pulp of a roaſted apple, moderately ſharp and ſweet. A bearing tree generally yields from two to eight pounds of nuts a year. The manner of curing them is to cut them down when ripe, and lay them in a heap to ſweat three or four days in the pods : after this the pods are cut, the nuts taken out, put in a trough, and covered with plantain-leaves, where they ſweat again about ſixteen or twenty days. After this they are put to dry three or four weeks in the ſun, and then they become of a rediſh dark colour. The pods grow only out of the body, or great limbs and boughs, and there are bloſſoms, with young and ripe fruit on the ſame tree at the ſame time.

The *wild cinnamon* is about twenty or thirty feet high, having many branches and twigs hanging downward, which form a very handſome top. The bark conſiſts of two parts, one outward and another inward ; the outward is thin, of a whitiſh grey colour, and of an aromatic taſte : the inward bark is much thicker than the true cinnamon, paler, and of a much more biting and aromatic taſte, ſomething like that of cloves. The leaves ſhoot out near the ends of twigs without any order, ſtanding on foot-ſtalks, each of them two inches in length, and one in breadth. They are of a yellowiſh green colour, and are ſmooth and ſhining, without any inciſures about their edges. The ends of the twigs are branched into bunches of ſcarlet or purple flowers, which falling off, are ſucceeded by cluſters of roughiſh green berries of the ſize of a large pea, that contain a pale green thin pulp, and four black ſhining ſeeds of an irregular figure. All the parts of this tree, when freſh, are very hot and aromatic ; but the inward bark of the tree is what is chiefly in uſe, both in the *Engliſh* plantations in the *Weſt Indies* and in *Europe*, and it is eaſily cured by only cutting off the bark, and letting it dry in the ſhade. The ordinary ſort of people in the *Weſt Indies* uſe it inſtead of all other ſpices, it being thought very good to conſume the immoderate humidity of the ſtomach, to help digeſtion, and expel wind. Rum loſes its diſagreeable ſmell if mixed with this bark.

In the courſe of the laſt war Lord *Rodney* captured a *French Eaſt India* ſhip, on board of which were ſeveral of the *ſpice* plants in a very healthy ſtate. Theſe the admiral preſented to the governor of *Jamaica* ; they were planted on the moſt favourable ſpots which could be choſen on the iſland, and have ſo far ſucceeded, that they promiſe, when arrived at a ſtate of maturity, to fructify, and yield a ſupply of thoſe valuable articles of merchandize. See a paper in the tranſactions of the Society for encouraging Arts, Manufactures and Commerce, for the year 1786, page 229.

Coffee is now much cultivated here : it is a large ſhrub, with leaves of a dark green ; the berries grow in great cluſters, and one buſh will produce ſeveral pounds. The berry is incloſed in a fine ſcarlet pulp, which is too luſcious to be palatable ; however many eat it. When it is ripe it turns black, and then the fruit is gathered, the berries ſeparated from the huſk, and expoſed to the ſun till they are well cured and fit for the market.

Here are alſo the *cabbage-tree*, the *cedar*, and the *maſtic-trees*, which grow to a great height ; the *mahogany-tree*, the *cotton-tree*, the *manchineel*, and a great number of others. The iſland likewiſe abounds with dyers woods, as *fuſtic*, *red-wood*, *logwood*, *&c.*

Among the drugs and medicinal herbs are *guaiacum*, *china-root*, *ſarſaparilla*, *caſſia*, *vaniloes*, *ginger*, *&c.* Ginger ſhoots forth blades from its root not unlike thoſe of wheat. The ſtalk ſeldom exceeds eighteen inches in height ; from its ſide grow ſharp-pointed leaves about five inches long, the extremity of the ſtalk ending in a ſoft pointed ſpire. When the plant is dug up, the roots are races of ginger, which are ſcraped clean, and dried in the ſun. The uſual time of planting this root is in May and June, and of digging it up in February and March.

Among the animals are the *land* and *ſea-turtle*, and the *alligator*. Here are all ſorts of fowl, wild and tame, and in particular more parrots than in any of the other iſlands ; beſides *parokeets*, *pelicans*, *ſnipes*, *teal*, Guinea *hens*, *geeſe*, *ducks*, and *turkies* ; the *humming-bird*, and a great variety of others. The rivers and bays abound with fiſh.

With reſpect to the reptiles and inſects ; among the mountains numberleſs *adders* and other noxious animals are bred, as are in the fens and marſhes the *guana* and *galliwaſp* ; but theſe laſt are not venomous. Among the inſects are the *ciron*, or *chegoe*, which eats into the nervous and membranous parts of the fleſh of the negroes, and the white people are ſometimes plagued with them. They get into the toes and eat the fleſh to the very bone. Theſe inſects enter any part of the body, but chiefly the legs and feet, where they breed in great numbers, and ſhut themſelves up in a bag. As ſoon as a perſon feels them, which is not perhaps till a week after they have entered the body, they pick them out with a needle or the point of a penknife, taking care to deſtroy the bag entirely, that none of the eggs, which are like nits, may be left behind. Muſkettoes are a terrible nuiſance here.

The Food, Dreſs, Buildings, Coin, Diſtempers, Manners and Cuſtoms of the Inhabitants of JAMAICA.

THE common bread here is *plantain*, *yams*, and *caſſava* ; the firſt is of an oblong form, grows in cluſters on the tree, and when pulled green and roaſted eats very deliciouſly. The *yams* are a kind of potatoe, but of a much larger ſize, ſome of them weighing ſeveral pounds. *Caſſava* is the root of a ſhrub taken and ſqueezed, the juice being a mortal poiſon ; yet this root, when properly prepared, is very wholeſome and agreeable food ; when dry it is grated and put in water, where it ſtands a conſiderable time ; the water being poured off, and the flour dried, it is made into cakes, and baked on a griddle over the fire. Theſe cakes are white and criſp, and are preferred by the *Creoles* to any other bread whatever. Theſe ſeveral kinds of food are not peculiar to this iſland, but are eaten in moſt of the other iſlands, and on the continent of *North America*.

There are ſuch plenty of hogs, that many plantations have ſeveral hundreds of them, and their fleſh is exceeding ſweet and delicate. Their beef is tough and lean ; the mutton and lamb tolerable: the cattle bred on the iſland are very few. The wool of the ſheep here reſembles the hair of a goat ; theſe ſheep are larger than thoſe in *England*. Here is a variety of wild-fowl, as well as common poultry ; and the *tortoiſe*, or turtle, caught on the coaſt, is much admired. They have alſo ſalt cod from *Newfoundland*, with ſalt beef from *Ireland*, for the ſlaves are ſeldom allowed freſh proviſions.

The common drink for perſons in affluent circumſtances is *Madeira* wine mixed with water; while thoſe of inferior rank drink rum-punch, which being frequently taken to exceſs, has obtained the name of "kill-devil:" thouſands loſe their lives by it, eſpecially thoſe who are juſt come to the iſland, for they cannot drink it to exceſs without expoſing themſelves to imminent danger; as, by heating the blood, it brings on fevers, which in a few hours ſend them to the grave. They have alſo ale and claret, but theſe are extravagantly dear.

With reſpect to dreſs, the heat renders many cloaths inſupportable, and therefore the men generally wear only thread-ſtockings, linen-drawers, a veſt, a handkerchief tied round the head, and a hat upon it. Wigs are never uſed but on Sundays, or in court-time, and then gentlemen appear very gay in coats of ſilk, and veſts trimmed with ſilver. The ſervants wear a coarſe linen-frock, which buttons at the neck and hands, long trowſers of the ſame, a checked ſhirt, and no ſtockings. The negroes generally go naked, except thoſe that attend gentlemen, who take care to have them dreſſed in their own livery.

The ladies make as gay an appearance here as in any part of *Europe*; they dreſs as rich, and appear with as good a grace. Their morning habit is a looſe night-gown, careleſsly wrapped about them; before dinner they put off their diſhabille, and ſhew themſelves in all the advantage of a rich, neat, and becoming dreſs. The ſervant-maids have generally a cotton or ſtriped *Holland* gown, and plain head-cloaths. Many of the negro women in the country go almoſt naked; for they do not know what ſhame is, and are ſurpriſed at an *European*'s baſhfulneſs; but in town they are obliged to wear a kind of petticoat, and ſome of them are neatly dreſſed.

The gentlemen's houſes are generally built low, of one ſtory, and conſiſt of five or ſix handſome apartments beautifully lined, and floored with mahogany; they have generally a piazza, to which is an aſcent by ſeveral ſteps, and this ſerves as a ſcreen againſt the heat. In the towns are ſeveral houſes two ſtories high; but this is diſapproved of, becauſe they are ſeldom known to ſtand the ſhock of an earthquake, or the fury of a ſtorm. The negroes dwell in poor miſerable huts built with reeds.

There are few gardens that deſerve notice; the chief curioſities they produce are *Engliſh peas*, *cabbages*, ſome kinds of *European* fruits, and others peculiar to the climate. The *apple-tree* ſeldom comes to any perfection, and continues to bear but a very few years; the ſame may alſo be ſaid of other fruits that thrive with us: indeed the plants and fruits which flouriſh here would alone be ſufficient to render the gardens more delightful than can be imagined; but they deſpiſe the orange, the lemon, the cacao, and the pomegranate; and prefer to the fine ſhade and fragrance of theſe a number of ſhrubs that are of no manner of uſe.

The current coin is entirely *Spaniſh*, and *Engliſh* money is ſeldom ſeen, except in the cabinets of the curious. There is no place perhaps where ſilver is ſo plentiful: they uſe no copper, and the loweſt piece is a ryal, which here paſſes for ſeven-pence halfpenny; but a halfpenny in *Britain* will go farther. A perſon cannot dine for leſs than a piece of eight, and the common rate of boarding is three pounds a week.

The common diſtempers here are high fevers and the belly-ach. The fevers are generally extremely violent, and a few hours frequently carry off the perſon afflicted with this diſorder. Few eſcape them on their firſt arrival, and many die by the firſt attack. The belly-ach, or dry-gripes, is the ſevereſt pain that can be endured: it frequently takes away the uſe of the limbs, which is never recovered. The common remedies for this diſeaſe are gentle doſes of phyſic and clyſters. After they are ſomewhat recovered, the cold bath proves of great uſe in reſtoring the patient to his former vigour. The phyſicians here generally make large fortunes, and there have been ſeveral at *Jamaica*, who have been very conſpicuous and eminent in the learned world.

The Diviſions and principal Towns of JAMAICA: *its Government and Trade; with a particular Account of the Logwood Cutters in the Bay of* HONDURAS, *and the Trade carried on with the* SPANIARDS *in* AMERICA.

THE whole iſland is divided into three counties, namely, *Middleſex*, *Surry*, and *Cornwall*. The county of *Middleſex* contains about 1,305,235 acres; it has eight pariſhes, fifteen towns or villages, and ſends ſeventeen repreſentatives to the houſe of aſſembly. The county of *Surry* contains 672,616 acres; it has ſeven pariſhes, twelve towns and villages, and ſends ſixteen members. The county of *Cornwall* contains 1,522,149 acres; has five pariſhes, ten towns or villages, and ſends ten members.

The following table gives a general view of the whole iſland.

	Pariſhes.	Members.	Towns.
Middleſex.	St. Catharine	3	St. Jago de la Viega, or Spaniſh town.
	St. Dorothy	2	Old Harbour.
	St. John	2	—

	Trelawney	2	Martha Brae, Falmouth.
		10	

PORT ROYAL was formerly the capital of the iſland; it ſtood upon the very point of a long narrow neck of land, which, toward the ſea, formed part of the border of a very noble harbour of its own name. In this harbour above a thouſand ſail of the largeſt ſhips could anchor with the greateſt convenience and ſafety; and the water was ſo deep at the quay of *Port Royal*, that veſſels of the greateſt burden could lay their broad-ſides to the wharfs, and load and unload at very little expence or trouble. This convenience weighed ſo much with the inhabitants, that they choſe this ſpot for their capital, though the place was a hot dry ſand, that did not produce any of the neceſſaries of life, and not even freſh water. However, its advantageous ſituation rendered it a conſiderable place, and it contained two thouſand houſes very handſomely built, and which let at as high a rate as thoſe of *London*. It grew to all this in about thirty years, and there were few places in the world which for the ſize could be compared to this town for trade, wealth, and an entire corruption of manners.

On the ninth of June, 1692, an earthquake, which ſhook the whole iſland to its foundations, overwhelmed the city, and buried nine-tenths of it eight fathoms under the water. This earthquake not only demoliſhed the city, but made a terrible devaſtation all over the iſland, and was followed by a contagious diſeaſe which was near giving the finiſhing hand to its deſtruction.

The city was rebuilt after the earthquake, but ten years after it was deſtroyed by a dreadful fire. Yet the extraordinary convenience of the harbour induced the inhabitants once more to rebuild it. But in 1722, one of the moſt dreadful hurricanes on record reduced it a third time to a heap of rubbiſh. Warned by theſe extraordinary calamities, the cuſtom-houſe and public offices were removed from thence, and the principal inhabitants ſettled on the oppoſite ſide of the bay at the town of *Kingſton*. *Port Royal* has, however, three or four handſome ſtreets, ſeveral croſs lanes, a fine church, an hoſpital for ſick and diſabled ſoldiers, and a yard for the king's naval ſtores, with conveniences for the workmen employed about the king's ſhips. The harbour is guarded by one of the ſtrongeſt forts in the *Weſt Indies*, which has a line of near a hundred pieces of cannon, and a conſtant garriſon of ſoldiers.

KINGSTON is well ſupplied with freſh water, and all manner of accommodations. The ſtreets are broad, perfectly ſtraight, and cut each other at right angles. It is about a mile long and contains above a thouſand houſes, many of them handſomely built, though low, with porticos, and every convenience for a comfortable habitation in ſuch a climate. Here the inferior courts ſit, and the receiver general, ſecretary, and ſurveyor, are obliged to keep offices. It has one or two churches, the Jews have two ſynagogues, and the Quakers a meeting-houſe. The fortifications of the harbour were greatly improved by Vice Admiral (afterward Sir Charles) *Knowles*, who was governor from the year 1752 to 1757.

Not far from *Kingſton* the river *Cobre*, a conſiderable but not navigable ſtream, falls into the ſea: and upon its banks ſtands ST. JAGO DE LA VEGA, or SPANISH TOWN, the ſeat of the government, and the place where the courts of juſtice are held, and conſequently the metropolis of *Jamaica*, though it is inferior in ſize to *Kingſton*. However, though it has leſs buſineſs, it has more gaiety. Here reſide many perſons of large fortunes, who make a very ſplendid figure.

The king of *Great Britain* appoints the governor and council of *Jamaica*; the repreſentatives of the people, which compoſe the houſe of aſſembly, are choſen by the freeholders. The council conſiſts of a preſident and ten members; the houſe of aſſembly, of forty-three members, one of whom is choſen ſpeaker. The governor is captain-general, admiral, and chancellor of the iſland; has power to iſſue out all ſorts of commiſſions; to ſummon and diſſolve aſſemblies; to make counſellors; to pardon all crimes, except treaſon or murder, and even for thoſe to grant a reprieve; to place and diſplace all officers who are not by patent: in a word, to act with ſovereign authority under his majeſty; and has a negative voice in all acts of the aſſembly. As he is chancellor, he is impowered to grant adminiſtrations of the eſtates of perſons dying inteſtate, and executorſhips; and this laſt brings in a conſiderable profit. His ſtated ſalary is two thouſand five hundred pounds a year; the aſſembly vote the governor as much more, and this, with the other great profits of his office, make it in the whole little inferior to ten thouſand pounds a year.

The militia is under the direction of officers appointed by the governor, and all from ſixteen to ſixty are enrolled.

The revenue of the iſland is reckoned to amount to ſeventy thouſand pounds, out of which are paid a great number of public officers, who have very large ſalaries.

The trade of *Jamaica* principally conſiſts in the following articles: firſt, *ſugar*, the ſecond is *rum*, of which they export about four thouſand puncheons. The third is *molaſſes*, in which they make a great part of their returns for *New England*, where there are great diſtilleries. Theſe are all the produce of their grand ſtaple the ſugar-cane. The fourth is *cotton*, of which they ſend out two thouſand bags. The fifth are various miſcellaneous articles, as cacao, coffee, a conſiderable quantity of pimento, ginger, ſweet-meats, drugs for dyers and apothecaries, mahogany, and manchaneel-plank. Some of the moſt conſiderable articles of their trade are with the continent of *New Spain* and *Terra Firma*; for in the former they cut great quantities of logwood, and both in the former and latter carry on an extremely profitable trade in negroes, and all the kinds of *European* goods carried thither from *Spain* by the flota.

Both the logwood and contraband trade have been the ſubject of much contention, and even the cauſe of a war between *England* and *Spain*. The cutting of logwood in the bay of *Honduras* on the ſouthern ſide of the peninſula of *Jacatan*, has been long claimed as a right by *England*; and this privilege was confirmed to his *Britannic* majeſty's ſubjects in the moſt expreſs terms by the treaty of peace in 1763.

The logwood-cutters are chiefly compoſed of vagabonds and fugitives from all parts of *North America*, and their way of life is ſuitable. They live in a kind of lawleſs manner, though they elect one among them whom they call their king, and to him pay as much obedience as they think fit. The country is low and extremely marſhy, the air moleſted by muſketoes, and the water infeſted with alligators; and yet a life of licentiouſneſs, a plenty of rum, large gains, and a want of thought, have reconciled them both to the hardſhips of their employment, the unwholeſomeneſs of the climate, and the other dangers to which their lives are expoſed. They go always well armed, and are ſaid to amount to about one thouſand five hundred men. This trade employs much ſhipping, finds employment for a number of ſeamen, conſumes a conſiderable quantity of *Britiſh* manufactures, and the value of returns are ſaid to be about ſixty thouſand pounds ſterling a year.

There is ſtill a more profitable trade carried on between this iſland and the *Spaniſh* continent, which has alſo been the cauſe of much diſpute between the courts of *England* and *Spain*. A ſhip from *Jamaica*, having taken in negroes, and a proper aſſortment of goods there, proceeds, in time of peace, to a harbour called the *Grout*, about four miles from *Porto Bello*. A perſon who underſtands *Spaniſh* is directly ſent aſhore, to give the merchants of the town notice of the arrival of the veſſel; the ſame news is likewiſe carried with great ſpeed to *Panama*, from whence the merchants ſet out diſguiſed like peaſants, carrying jars almoſt filled with ſilver; but the top covered with meal, to deceive the officers of the revenue. Here the ſhip frequently remains trading five or ſix weeks together. The *Spaniards* uſually come on board, leave their money, and take their negroes, and their goods packed up in parcels making a load for a man, after they have been firſt handſomely entertained on board, and received proviſions ſufficient for their journey home. If the whole cargo is not diſpoſed of here the captain bears off eaſtward to the *Brew*, a harbour about five miles from *Carthagena*, where he ſoon finds a market for the reſt. There is no trade more profitable than this; for they are paid in ready money, and the goods ſell higher than at any other market. It is not on this coaſt alone, but every where upon the *Spaniſh* main that this trade is carried on; nor is it by the *Engliſh* only, but the *French* from *Hiſpaniola*, the *Dutch* from *Curaſſoa*, and even the *Danes* have ſome ſhare in it. However, when the *Spaniſh* guarda coſtas ſeize upon one of theſe veſſels, they make no ſcruple of confiſcating the cargo, and of treating the crew little better than if they were pirates.

By an order of the king in council, dated 24th of March 1786, for regulating the trade and commerce with the *United States* of *America*, as far as it reſpects the *Weſt India* iſlands, all articles of merchandize brought from any of the *American* ſtates to any of the *Britiſh Weſt India* iſlands are required to be conveyed by *Britiſh* ſubjects only, and in no other than *Britiſh* built ſhips, belonging to the ſubjects of *Great Britain*, and navigated according to law. The articles permitted to be imported into the *Weſt India* iſlands under ſuch reſtrictions and regulations are ſpecified to be pitch, tar, turpentine, hemp and flax, maſts, yards and bowſprits, ſtaves, heading boards, timber, ſhingles, and all other ſpecies of lumber; horſes, neat cattle, ſheep, hogs, poultry, and all other ſpecies of grain, being the growth or production of any of the *United States* of *America*; alſo tobacco, in the fair and lawful way of barter and traffic. The articles permitted to be exported from the *Weſt India* iſlands to the ſtates of *America* are ſpecified to be, rum, ſugar, molaſſes, coffee, cocoa-nuts, ginger, and pimento. Theſe are required to be conveyed thither by *Britiſh* ſubjects, in *Britiſh* ſhips, navigated according to law; that is, two thirds of the crew being natural born ſubjects of *Great Britain*; and the ſame duties are to be paid upon the exportation of ſuch merchandize, as are paid for the ſame articles when exported to any *Britiſh* colony or plantation in *America*.

The ſtate of the cuſtoms in the ſeveral ports of the iſland of *Jamaica*, in the year 1784, appears, by the 15th report of the commiſſioners appointed to examine the public accounts, to be as follows:

PAYMENTS.

	Salaries. £.	Incidents. £.	Groſs Duties.	Net Duties.	Deficiences on Balance.
Kingſton -	920	10	1,960	983	
Savannah le Mar -	300	47	2	-	398
St. Lucea - -	300	35	18	-	407

Hiſtory of JAMAICA.

THE iſland of *Jamaica* was diſcovered by *Columbus* in his ſecond voyage, in the year 1594; his ſon *Don Diego* was the firſt *European* governor of the iſland, and built the city of *St. Jago de la Vega*, now *Spaniſh Town*. On the firſt arrival of the *Spaniards* the *Indians* appeared in arms, and bravely reſolved to maintain their liberties againſt theſe bold intruders; and had certainly been ſucceſsful, at leaſt for a while, had not the *Spaniards* at length taken advantage of their ſimple natures, and deluded them by ſpecious ſhews of peace and deeply diſſembled proteſtations: but they in a ſhort time felt the diſmal effects of giving faith to the *Spaniards*, who were no ſooner in a condition to put their bloody deſigns in practice, than they began a horrid maſſacre, murdered, butchered, and deſtroyed, in a few years, to the amount of ſixty thouſand of the natives, and ſcarce left one alive. Some took refuge in the woods, and retired to the caves and faſtneſſes, whither they were purſued and hunted by thoſe ſavage tyrants, and cut to pieces. Before this deſolation *Jamaica* was one of the beſt peopled iſlands of the *Antilles*; but ſuch was the deſtructive ſlaughter which the *Spaniards* made, that the very name of an *Indian* was in a few years rooted out, and none left to preſerve the memory of that once flouriſhing people.

This iſland was poſſeſſed by the *Spaniards* till *Oliver Cromwell*, ſenſible of the advantages they obtained from their provinces in *America*, ſent a conſiderable ſquadron of men of war, commanded by the generals *Penn* and *Venables*, in 1654, to take the fine iſland of *Hiſpaniola*. This they attempted, but being repulſed with loſs, the principal commanders fearing to return to *England* without ſucceſs, wiſely reſolved to try what could be done againſt the iſland of *Jamaica*, before the inhabitants of that iſland ſhould be ſpirited up by the news of the repulſe at *Hiſpaniola*. Having made good their landing, they attacked and took a fort, and ſoon obliged the *Spaniards* to capitulate; who obtained good terms, and were ſecured in their perſons and effects. Notwithſtanding which many of the *Spaniſh* negroes retiring to the mountains maintained their ground there, and being afterward joined by ſeveral other fugitives from the *Engliſh* plantations, became very formidable; nor could they be ſubdued, though a body of regular troops was ſent over to the aſſiſtance of the planters. At length governor *Trelawney*, who preceded *Sir Charles Knowles*, entered into a treaty with them, by which it was agreed that they ſhould remain an independent ſtate, and be governed by their own magiſtrates, on condition that they protected no more fugitives. They are ſaid now to live in a very friendly manner with the *Engliſh*, and, in caſe of an invaſion, ſome imagine they would contribute greatly to the defence of the iſland; while others ſuppoſe that theſe negroes are not yet to be truſted, and for this reaſon ſome of the beſt lands in the iſland which lie in their neighbourhood are not cultivated.

After the Reſtoration the *Spaniards* ceded *Jamaica* to the king of *England* by treaty. Some of the troops employed in its reduction had ſettled there; many of the royaliſts, who had been uneaſy at home, had ſought an aſylum in this iſland, and not a few planters from *Barbadoes* were invited thither by the extraordinary fertility of the ſoil, and the other advantages which it afforded. The latter taught the former ſettlers the manner of raiſing the ſugar-cane, and making ſugar; for at firſt they had wholly applied themſelves to the raiſing of cacao, as the *Spaniards* had done before them. It was very happy for them that they fell into this new practice, for the groves of the cacao-trees planted by the *Spaniards* began to fail, and the new plantations did not thrive.

What gave freſh life to this ſettlement, and at once raiſed it to a ſurpriſing pitch of opulence, which it has ſince ſcarcely equalled, was the reſort thither of the pirates called the *Buccaneers*. Men who fought with the moſt deſperate bravery, and ſpent their plunder with the moſt laviſh extravagance, were welcome gueſts in *Jamaica*. They often brought very large ſums in pieces of eight, which were immediately ſquandered in exceſſive gaming, wine, and women. Thus vaſt fortunes were made, and the returns of treaſure to *England* were prodigious. By this means the inhabitants had raiſed ſuch funds, that when this ſource of wealth failed by the ſuppreſſion of the pirates, they were enabled to turn their induſtry into better channels; and they increaſed ſo faſt, that it was computed there were ſixty thouſand whites, and a hundred and twenty thouſand negroes on the iſland.

But while the inhabitants were filled with the gayeſt hopes and rendered arrogant and luxuriant by wealth, one of the moſt violent earthquakes that perhaps was ever felt plunged them, in an inſtant, into an abyſs of miſery. Of this we have taken notice in treating of the deſtruction of *Port Royal*, in which city two thouſand whites and blacks periſhed. At the ſame time the houſes all over the iſland were thrown down, and the ſurviving inhabitants forced to dwell in huts. Two great mountains falling, ſtopped the courſe of a river, and cauſed it to become dry from that place for a whole day, by which means vaſt quantities of fiſh were obtained to the great relief of the diſtreſſed. An high mountain was ſplit, and part of it falling upon a level plain, overwhelmed ſeveral ſettlements; and almoſt all the ſhips and ſloops in the harbour were loſt. A general ſickneſs ſucceeded, which carried off a great number of thoſe inhabitants which the earthquake had ſpared.

The enemies of *Great Britain* were not idle ſpectators of ſuch a dreadful event; the *French* propoſed to make an eaſy conqueſt of a ruined iſland, where poverty, ſickneſs, and every hardſhip prevailed; ſo much was *Jamaica* changed! They invaded the iſland with firm hopes of ſucceſs: but though the inhabitants had ſo many difficulties to ſtruggle with, they ſtill retained their priſtine ſpirit and native courage; the invaders were repulſed, and only eighteen of them left to carry the news of their defeat. Their loſſes, however, ſeem not yet to have been fully repaired. It is ſaid that at preſent the white inhabitants ſcarcely exceed twenty-five thouſand ſouls, and yet the blacks are computed to amount to near ninety thouſand; an amazing diſproportion!

The CARIBBEE ISLANDS.

ANGUILLA *and* BARBUDA.

WE now proceed to ſuch of the *Caribbee Iſlands* as are ſubject to *Great Britain*. This name ſeems to have been given to ſome of thoſe iſlands before they became ſubject to the *Spaniards*; and at the time when *Columbus* diſcovered this part of the world, theſe iſlands were poſſeſſed by a fierce and ſavage race of men, who were the terror of the iſlanders more to the weſtward. Ten of theſe iſlands at preſent belong to the *Engliſh*; theſe are *Anguilla*, *Barbuda*, *St. Chriſtopher's*, *Nevis*, *Antega*, or *Antigue*, *Montſerrat*, *Dominica*, *St. Vincent*, *Barbadoes*, *Granada*, with the *Granadines*, or *Granadillos*. The firſt ſix with *Guadaloupe*, &c. are alſo termed *Leeward Iſlands*; and the laſt four with *Martinico* and *Tobago* are named *Windward Iſlands*.

ANGUILLA, or SNAKE ISLAND, is a long and narrow tract, winding ſomewhat in the manner of a ſnake, whence it received its name. This, which is the moſt northerly of the *Caribbee Iſlands* poſſeſſed by the *Engliſh*, is ſituated in 18° 15′ N. latitude, and 62°. 35′. W. longitude: it is ten leagues in length and three in breadth.

This iſland is woody, but perfectly level. Its climate is nearly the ſame with that of *Jamaica*. It abounds with tame cattle, with which it has been ſtocked by the *Europeans*; and alſo with the *opoſſum*, *muſk-rat*, *alligator*, and other animals common in the ſame climate. The *Engliſh* ſettled here in 1650. At preſent they chiefly ſubſiſt by huſbandry, and make a little ſugar. They are far from being remarkable for their induſtry, or their numbers; and have been frequently pillaged by the *French*, who in 1745 made a deſcent upon the iſland, to the number of a thouſand men, when ſix hundred of them, marching up to attack a breaſt-work, were ſo well received by the continual fire of a hundred men poſted there to defend it, that they were obliged to retire with the loſs of a hundred and fifty men, beſides ſome of their colours and fire-arms.

BARBUDA is ſeated in 17°. 50′. N. latitude, and in 61°. 50′. W. longitude, thirty-five miles to the N. of *Antigua*, fifty-three N. E. of *St. Chriſtopher's*, and ninety S. E. of *Anguilla*. It extends twenty miles in length, and twelve in breadth. The land is low and fertile; on the W. ſide it has a good road well ſheltered, and clear of rocks; but from the N. W. and S. W. points two ſhoals of ſand run above two leagues into the ſea.

This iſland produces *citrons*, *oranges*, *pomegranates*, *Indian figs*, *grapes*, *pine-apples*, the *ſenſitive-plant*, *cocoas*, *cotton*, *pepper*, *ginger*, *cinnamon*, *caſſia*, *Braſil-wood*, and *ebony*; with *tobacco*, *indigo*, *maize*, *potatoes*, *yams*, and other roots and drugs.

Here are plenty of cows, ſheep, goats, and fowl; the breeding of all which is the chief employment of the inhabitants, who make a conſiderable profit by ſelling them to the other iſlands; the *Engliſh* here living much after the ſame manner as our farmers, and have no immediate trade with *England*. Here are likewiſe *ſerpents* of various kinds, ſome very large and not poiſonous, which are of ſervice in deſtroying rats, toads, and frogs; but the bite of others is incurable if a remedy be not immediately adminiſtered.

This colony was planted as early as any of the *Leeward Iſlands*, except *St. Chriſtopher's*; but was ſo often diſturbed by the *Caribbs*, that the people were frequently forced to abandon their plantations; but theſe diminiſhing daily in number, and the *Europeans* in the other iſlands increaſing, the *Engliſh* again poſſeſſed themſelves of *Barbuda*: in a few years the inhabitants amounted to five hundred, and they are now increaſed to about thirteen or fourteen hundred. The iſland is ſubject to a gentleman of the name of *Codrington*, who chooſes the governor, and enjoys the ſame prerogatives as the other lords proprietors in *America* were wont to do.

ST. CHRISTOPHER.

THE iſland of ST. CHRISTOPHER, commonly called ST. KITT's, lies 17°. 15′. N. latitude; and 62°. 43′. W. longitude, from *Greenwich*, it being about ten miles to the W. of *Nevis*, and fourteen leagues from *Antigua*. It extends twenty-five miles and a half in length; but its greateſt breadth is no more than ſeven.

At the top of the *Conorrhee-hills* is a plain, not three hundred yards wide, ending at the edge of a cavity of a prodigious depth, and about a mile in circumference, containing ſulphur, from which riſe continual clouds of ſteam. A furlong to the S. E. is a large rocky hill, called *Mount-Miſery*, from a raſh man, who, attempting to aſcend the precipice, fell backward, and was killed. This is the higheſt point of land on *St. Chriſtopher's*, and it is ſaid to riſe about a mile and a half perpendicular from the ſea. In the ſulphureous cavity abovementioned are two or three round holes in the earth, vulgarly called the *Devil's Coppers*: they are two yards aſunder, and each about three feet in diameter. Mr. *Smith* ſays, that when he ſaw them, they boiled fiercer than ever he ſaw a ſugar-copper. On this hill there is a great quantity of pure brimſtone, and on its top is a powder-magazine.

St. Chriſtopher's is repreſented by ſome writers as one of the moſt delightful iſlands in the world. Its mountains, notwithſtanding there are dreadful rocks and thick woods between them, riſe one above another, and are adorned by rows of trees that wear a perpetual verdure, intermixed with handſome houſes covered with ſhining ſlate. The ſoil is light and ſandy. It is well ſupplied with ſprings, and at the foot of the mountains on the S. E. part of the iſland there are ſome hot ones proper for baths; yet in ſome places water is ſcarce. The iſland alſo affords much *ſalt*, which is produced in a ſalt lake, ſuppoſed to contain about eighty acres; where the ſun, exhaling the water during the dry ſeaſon, leaves a cruſt of ſalt at the bottom that exactly reſembles rock-cryſtal.

The animals are much the ſame as thoſe in the other *Caribbee Iſlands*; but the moſt remarkable of its beaſts is the *rocket*, a kind of lizard, whoſe ſkin reſembles a withered leaf, with yellow or blue ſpots. It has ſparkling eyes, always holds up its head, and is in perpetual motion. Its tail turns up toward its back in a circle and a half, and when purſued it puts out its tongue.

The moſt remarkable of the birds, are the *orinoca eagle*, and the *craw-fowl*. The feathers of the former are a light grey, curiouſly diverſified with black ſpots, and the ends of the wings and tail are yellow. It attacks only ſuch birds as have crooked beaks and ſharp talons like itſelf, and always ſeizes them flying.

The *craw-fowl*, which is as big as a large duck, is aſh-coloured, has a great head, ſmall eyes, and a ſhort neck, under which is a craw that will hold two gallons of water. It lives upon fiſh, which it watches from trees on the ſhore, and ſometimes dives in for them above a fathom under water. It is ſo intent on its prey that it is eaſily ſhot; but is not fit for food.

Though no bees are hived, either here or in the iſland of *Nevis*, yet there is a great deal of honey produced by the wild bees; but it will not make mead, on account of the warmth of the climate.

The inhabitants are computed to amount to about eight thouſand whites and eighteen thouſand negroes. When it was inhabited by the *French*, they dwelt nearer together than the *Engliſh*, who live ſcattered up and down the country, for the convenience of planting; but have as fine houſes as any in *America*, they being of cedar, adorned with walks and groves of orange and lemon-trees.

The fortifications of the iſland are, a fort erected on *Brimſtone-hill*, ſaid to be impregnable, and planted with forty-nine pieces of cannon. *Charles-fort*, which is furniſhed with forty pieces of ordnance, and a ſufficient quantity of ſtores; and *Londonderry-fort*, on the eaſt-ſide of *Baſſe-Terre*. There are alſo ſix batteries raiſed at ſo many landing-places, mounted with forty-three cannon in all.

The iſland is divided into the pariſhes of *St. John*, *Chriſt-church*, and *St. Mary*, on the N. *St. Ann*, *St. Thomas*, and *Trinity*, on the S. ſide.

Basse-Terre, the capital of the iſland, is a fine town built by the *French*, under the cannon of their fort. The houſes are of good brick, free-ſtone, and timber; and among other buildings, are a town-houſe, an hoſpital, and a large church. They erected their caſtle on the E. ſide of a high mountain, ſhaded with lofty evergreen trees, about a mile and a half from the ſea. Between the caſtle and the mountains is a large and beautiful garden, that produces the moſt delightful flowers and plants of *Europe* and *America*, and is adorned with a fountain.

The iſland has a militia, conſiſting of one regiment of foot, a troop of horſe, and another of dragoons, amounting in the whole to about one thouſand three hundred and forty men.

The ſtate of the commerce which was carried on at the port of *Baſſe-Terre*, in the year 1784, may be inferred from the ſtate of the cuſtoms; the groſs produce of duties was that year 353 *l.* ſterling: the ſalaries paid amounted to 347 *l.* and the incidental charges to 152 *l.* There is likewiſe another port on the iſland called *Sandy-point*, where duties on merchandize is received; their amount that year was 34 *l.* whilſt the ſalaries were 270 *l.* and the incidental charges 167 *l.* This iſland pays a duty of four and a half per cent. impoſed in the reign of Charles II. on the dead commodities of its produce exported. It was taken by the *French*, in the year 1782, but reſtored to *Great Britain* by the 10th article of the peace, made in the following year.

Nevis.

THIS iſland is three or four miles ſouth-eaſt of *St. Chriſtopher*'s; from hence may be diſtinctly perceived, in a clear day, the iſlands of *Euſtachia*, *Saba*, *St. Bartholomew*, *Antigua*, *Guadaloupe*, *Montſerrat*, and *Barbuda*. It is only ſix leagues in circumference, and has a high mountain in the centre, ſaid to be exactly a mile and a half perpendicular; the iſland is covered with plantations and trees.

The climate is ſaid by ſome to be even hotter than that of *Barbadoes*, though the latter is much nearer to the line. Fevers are very rife here, eſpecially in October, when the trade winds veer from the E. to the N.

The land is very fertile; *Engliſh beans* bloſſom in the mountain plantations, but never pod; yet the *ſamphire*, *cucumbers*, common *lettuces*, *kidney-beans*, *celery*, and *naſturtiums*, &c. are excellent. Among the trees is one called the *diddledoo*, reſembling a codling-tree, but with narrow thin leaves. It bears a beautiful bloſſom of the fineſt yellow and ſcarlet colours.

Though the vallies are fruitful, the riſing ground is ſtony, and the plantations grow worſe in proportion as they riſe toward the ſummit of the mountain. The produce of this is much the ſame as in the other *Caribbee Iſlands*: they have oranges, limes, and lemons; but *ſugar*, which is the ſtaple commodity, anſwers all the purpoſes of money, and all the trade of the iſland is managed by it. Their ſugar is for the moſt part muſcovado; *tobacco*, *cotton*, and *ginger* were formerly much cultivated; but all theſe have been neglected to make way for the ſugar-cane, which produces ſuch plenty of ſugar, that fifty or ſixty ſhips have been laden with it in this ſmall iſland, within a year, for *Europe*.

Here are ſeveral ſorts of *lizards*, ſome of which are ſo large as to be five feet from the head to the tail, which is of the ſame length.

The *land-pike* is ſo called from its reſembling the fiſh of that name; but inſtead of fins it has four feet, which are ſo weak that it crawls ſlowly along, and winds its body like a pike freſh taken out of the water. It is about ſixteen inches in length; its ſkin is of a ſilver grey, covered with little ſhining ſcales. In the night they make a noiſe under the rocks more hideous than the croaking of frogs and toads.

One of the moſt extraordinary animals is a kind of *ſnail*, called "the *ſoldier*," becauſe, having no ſhell of its own, it creeps into the ſhells that are driven on ſhore, in which it accomodates itſelf like a ſoldier, who takes up his quarters in other people's houſes. As it grows bigger it gets into larger ſhells, which it finds empty, and appears of ſeveral forms and figures, according to the diverſity of the ſhells of which it takes poſſeſſion. For its defence it has ſomething reſembling the claw of a large crab-fiſh, with which it cloſes the entrance of the ſhell, and thus ſecures its whole body, all of which, except the head and claw, is very tender. This claw is jagged within, and takes ſuch firm hold of whatever it faſtens on, that it takes away the piece. This creature moves faſter than the common ſnail, and does not mark its track with any ſlime. When put near the fire it forſakes its quarters; and if its ſhell be preſented to it to enter it again it goes in backward. Mr. *Rochefort* ſays, that when there are many of theſe met together in order to change their quarters, if they find but one ſhell they contend for it with great eagerneſs, and an obſtinate engagement enſues, in which they grapple with one another, till the weaker being forced to ſubmit, the victor takes poſſeſſion of the ſhell in diſpute, and peaceably enjoys it in right of conqueſt.

Here is a pretty little flying inſect, with four legs, and of various beautiful colours, called a *fly-catcher*, from its entering rooms, and preſently clearing them of all flies and other vermin. It alſo lies down on planks, waiting for the flies, and puts its head into different poſtures on its ſeeing them ſhift their places. It frequently ſtands with its mouth half open, and when it ſees an advantage leaps directly on its prey, which it ſeldom miſſes; and is ſo tame, that it will come on the table when people are eating, and catch the flies that ſettle on their hands or clothes.

There are here *land-crabs* much ſmaller than our ſea-crabs; theſe make little burrows like rabbits in the woods high up the mountains; but come down every year to the ſea to waſh and ſhed their ſhells, and then are eaſily caught at night by torch-light. Their claws are long and ſlender, which enables them to move faſt. Theſe crabs make their way with ſurpriſing expedition through timber planks, and have ſuch an eagerneſs to devour dead bodies, that they have been frequently known to penetrate a coffin, within twenty-four hours after a corps has been depoſited in the earth, and they preſently reduce it to a mere ſkeleton. The only venomous creatures here are *centipedes* and *ſcorpions*.

Here are different ſorts of ſhell-fiſh, and in the ponds near the ſea are *crabs* of a beautiful ſky-blue, with a browniſh yellow ſhade round the edges. They are much leſs than thoſe of *Europe*, but finer ſhaped both in the body and claws; the fine colour of their ſhells vaniſhes with the life of the creature.

Thoſe of the inhabitants that are deſcended from *Europeans* are computed at about three thouſand, and the negroes at three times that number, of whom at leaſt four thouſand are employed in the ſugar-trade. The militia is computed at about three hundred men; but there is only one fort in the iſland, which is mounted with nineteen guns.

Though much ſhipping comes to the iſland, it has not one good harbour, nor any tolerable anchoring except on the S. W. ſide, where are ſeveral rocks and ſhoals, between which ſhips ride in ſafety; but in caſe of an hurricane they put out to ſea, and if poſſible run into *Antigua*.

The only town in the iſland is *Charles Town*, which has large houſes, and ſhops well ſtored, and is defended by the above fort.

The government of *Nevis* is veſted in a governor, council, and aſſembly, who can make any law that will laſt twelve months; but not longer, unleſs it be confirmed by the king.

The receipts from the cuſtoms were, ſix years ago (from 1790), 33 *l.* ſterling; the ſalaries to officers 394 *l.* and incidental charges 65 *l.* *Fifteenth report of Commiſſioners, &c.* This iſland was taken bythe *French* in the late war, but reſtored by the peace.

ANTIGUA, *or* ANTEGO.

THE iſland of *Antigua* is ſeated in 17°. 4'. N. latitude, and in 60°. 9'. W. longitude, to the E. of *Nevis* and *St. Chriſtopher*'s, and is ſomewhat of a circular form, about ſix leagues from E. to W. the ſame diſtance from N. to S. and about ſixty miles in circumference. It abounds more with good harbours than all the other *Engliſh* iſlands in theſe ſeas; yet is ſo encompaſſed with rocks, that it is in many parts of dangerous acceſs. The principal harbours are *Willoughby-bay*, near two leagues to the S. E. of *Green Iſland*; *Nonſuch* harbour, a ſpacious bay at the E. end of the iſland; *Five Iſland* harbour, on the W. ſide of the iſland, ſo called from five little iſlands that lie to the W. of it; *St. John*'s harbour, due W. from the former, and about two miles from it by land, is a kind of double harbour, which is the beſt in the iſland, but a ſandy bar runs acroſs the mouth of it, the deepeſt part of which is at the S. W. end. This harbour is defended not only by a fort at the mouth of *St. John*'s river, mounted with fourteen guns, but by ſeven other batteries raiſed for the defence of ſo many landing-places. *Falmouth* harbour is defended by *Fort Charles* and *Monkſhill* fort. Here are alſo *Engliſh* harbour and *Carliſle* harbour.

The climate is here hotter than that of *Barbadoes*, and the iſland is very ſubject to hurricanes. The ſoil is ſandy, and much of it overgrown with wood: the iſland has alſo but few ſprings, and not ſo much as a ſingle brook, ſo that its chief dependence for water is upon what falls from the clouds, and therefore the inhabitants are ſometimes diſtreſſed for want of it: yet, notwithſtanding all theſe inconveniences, it is a thriving and a very conſiderable place. It produces much the ſame commodities as the other *Caribbee Iſlands*, particularly *ſugar* and *tobacco*. Their ſugar was, however, at firſt ſo black and coarſe, that being rejected by our ſugar-bakers, it was generally ſhipped off for *Holland* and *Hamburgh*, where it fetched only ſixteen ſhillings *per* hundred, at a time when other muſcovado ſugar fetched eighteen or nineteen ſhillings: but the planters have ſince ſo far improved their art, that as good muſcovado ſugar is made here as in any of the ſugar iſlands, and they have alſo acquired the art of claying it.

This iſland contains about ſeventy thouſand acres, and produces, one year with another, ſixteen thouſand hogſheads of ſugar.

The iſland has more veniſon than any other of the *Caribbees*, and has a conſiderable number of black cattle and fowl, with moſt of the animals common to the other iſlands.

Antigua is divided into five pariſhes, and has the following ſmall towns; namely, on the N. W. part is *St. John*'s town, the capital, which is one of the moſt regular towns in the *Weſt Indies*, and has the moſt commodious harbour of any of the *Leeward Iſlands*, but conſiſts of only two or three hundred houſes. On the S. ſide are *Falmouth*, *Parham*, and *Bridge-town*: and in the centre of the iſland is *St. Peter*'s. The people here are computed at about ſeven thouſand whites, and thirty thouſand blacks.

It is ſaid to have been firſt diſcovered by the *Engliſh* in the time of Sir *Thomas Warner*, already mentioned, and that ſome *Engliſh* families ſettled upon it in 1636; but the firſt grant of this iſland from the crown appears to have been made by *Charles* II. about the year 1663, to *William* lord *Willoughby* of *Parham*, who planted a colony there about the year 1666; he was made governor of the *Caribbee Iſlands*, and loſt his life the ſame year in an hurricane near *Martinico*. But it does not appear that *Antigua* made any conſiderable figure among the *Leeward Iſlands* till the year 1680, and it ſeems that its improvement ſince has been chiefly owing to the care of colonel *Chriſtopher Codrington*, the deputy-governor of *Barbadoes*, who removed hither; and, after planting a good part of it, made this iſland the ſeat of his government, when he was captain-general of all the *Leeward Iſlands*. This rendered *Antigua* populous, rich, and flouriſhing.

In 1681 the inhabitants ſuffered greatly by a terrible hurricane, and alſo by another in 1689, when moſt of the houſes, ſugar-works, and wind-mills, were thrown down.

There are two of the ports at which a cuſtom-houſe is eſtabliſhed; namely *St. John*'s, and *Parham*, in *Willoughby bay*. In the year 1784, the net receipts at the former were 145 *l.* ſterling, at the latter nothing: whilſt the ſalaries at *St. John*'s amounted to 505 *l.* at *Parham* to 200 *l.* the incidental charges at both ports to upward of fifty pounds. On this iſland a duty of four and a half per cent. is levied on the produce, when exported.

MONTSERRAT.

THIS iſland was diſcovered by *Columbus* in 1493, who gave it this name from its reſembling a mountain ſo called near *Barcelona*. It lies twenty-five miles almoſt S. S. E. of *Nevis*, forty N. W. of *Guadaloupe*, twenty W. S. W. of *Antigua*, and two hundred and forty from *Barbadoes*. It is ſomewhat of an oval form, about nine miles in length, the ſame in breadth, and about eighteen miles in compaſs. Latitude 16°. 47'. N. longitude 62°. 17'. W. from *Greenwich*.

Its mountains are covered with *cedars*, *cypreſs-trees*, *acomas*, and the *muſk-herb*, which grows like the bramble, but without thorns, and bears yellow flowers that afterward turn to pods full of ſeeds that have the ſmell of muſk.

On the mountains grows the tree termed *iron-wood*, which does not exceed thirty feet in height, and the trunk is, in proportion, ſomewhat ſlender. It is covered with a whitiſh bark, but that upon the upper branches is of a reddiſh grey. The leaves, which are ſmooth, and of a yellowiſh green, are two inches and a half long, and above an inch broad. The flowers are many and white; theſe riſe in groupes upon one common pedicle, and are ſucceeded by ſmall berries half an inch long, whoſe outward tegument, as well as the inward pulp, is of the fineſt red, interſperſed with ſmall ſeeds. This tree has the name of iron-wood from its hardneſs, its great weight, and the cloſeneſs of its grain. It is ſo heavy that it will ſink in water; it is proof againſt all weathers, and in ſeveral ages ſcarce ſuffers any decay.

The valleys of this iſland are well watered, and fruitful. Its chief produce is *indigo*, great quantities of which uſed to be exported to *Great Britain*. The inhabitants likewiſe make ſome *ſugar*, which is ſaid not to be ſo fine as that of *Jamaica* or *Barbadoes*.

This iſland is ſurrounded with rocks, and has no place that can be properly called a haven; ſo that on the approach of a hurricane ſuch ſhips as happen to be on the coaſt are obliged to put to ſea, and with all poſſible expedition to ſail to *St. Chriſtopher*'s or *Antigua*.

No ſettlement was made upon it till the year 1632, when Sir *Thomas Warner*, the firſt governor of *St. Chriſtopher*'s, ſettled a ſmall colony here. It at firſt flouriſhed more than *Antigua*, but the latter iſland has ſince got the ſtart of it. It is computed that it has at preſent about four thouſand whites, and one thouſand two hundred negroes. They have two pariſh-churches, lined with cedar, whoſe pulpit and pews are alſo of that and other ſweet-ſcented kinds of wood.

In the year 1784 the net amount of duties on merchandize, received on this iſland, and brought to the public revenue of the kingdom, was 82 *l.* ſterling, whilſt the expences of ſalaries were 287 *l.* and the incidental charges 152 *l.*

DOMINICA.

DOMINICA, or DOMINIQUE, which owes its name to its being diſcovered by *Columbus* on a Sunday, is the moſt northerly of the *Windward Iſlands*. It is ſeated in 15°. 18'. N. latitude, and in 61°. 28'. W. longitude, about half way between *Guadaloupe* and *Martinico*, and fifteen leagues from each. This iſland extends about thirteen leagues in length, from the N. W. to the S. E. and near as much over in its broadeſt part. It is ſomewhat,

what larger than *St. Vincent*; in the centre are inacceſſible mountains, from whence flow ſprings of excellent water.

Moſt of the *Caribbeans* retiring hither on their being driven out of the other iſlands by the *Europeans*, they are now very numerous. The *French* having frequented the iſland more than the *Engliſh*, are ſaid to be beſt regarded by the natives.

Near one thouſand *Caribs* inhabited this iſland in 1730, whilſt three hundred and fifty *French*, and about as many ſlaves, poſſeſſed a part of it. It was taken by the *Engliſh* in 1761, by a fleet commanded by Sir *James Douglas*, having a body of land forces under Lord *Rollo*, and was ceded to *Great Britain* at the peace of *Paris* in 1763; at which time the white people on the iſland had increaſed to ſix hundred, and the ſlaves amounted to two thouſand.

The *Abbé Raynal* ſuppoſes this ſettlement capable of yielding, in proceſs of time, with great labour, three or four thouſand hogſheads of ſugar yearly. Its ſituation in the mid-way, between *Martinico* and *Gaudaloupe*, made it a very deſirable poſſeſſion to the *Engliſh*, both in time of peace and war; as at the one ſeaſon a very lucrative contraband trade can be carried on, and at the other, its ſafe and commodious harbours, enabled the *Engliſh* privateers and ſhips of war to annoy the *French* commerce, and particularly to diſturb the communication between her two principal iſlands.

Notwithſtanding much attention was paid to the means of ſtrengthening and ſecuring this iſland againſt any hoſtile attack, by furniſhing it with cannon and ammunition to a large amount, and in vaſt quantities, yet no troops were ſent over for its defence, it was therefore rendered an eaſy conqueſt when the *French* made a deſcent on the iſland in the year 1778; but it was reſtored to *Great Britian* by the treaty of peace in 1783.

The ſtate of the commercial expenditure and revenue at the port of *Roſeau*, on the iſland of *Dominica*, in the year 1784, was—ſalaries 780*l.* incidents 240*l.* deficiency of revenue after defraying all charges 56*l.* *Report of Commiſſioners, &c.*

ST. VINCENT

IS ſituated from 13° 1′ to 13° 13′ N. latitude, and in 61°. W. longitude; fifty-five miles W. of *Barbadoes*, and about four leagues to the S. S. E. of *St. Lucia*. It is about twenty-four miles in length, eighteen in breadth, and ſixty in compaſs.

This iſland has a deep fat ſoil, capable of producing every thing proper for the climate, and has abundance of rivulets and ſprings of excellent water. It has ſeveral mountains with plains at the bottom, which, if cultivated, would be exceeding fruitful. There are here large ſtreight trees of all the kinds produced in *America*: *tobacco* has been cultivated here, and is eſteemed excellent; together with *mandicoa*, *Turkey-wheat*, *potatoes*, *ignamas*, *gourds*, and the fineſt and largeſt *melons*; *indigo* alſo thrives here remarkably well.

This iſland, as well as that of *Dominica* and *St. Lucia*, was, in 1669, inhabited by a race of men ſuppoſed to be deſcended from the aborigines of this *Archipelago*, to whom the contending kingdoms of *England* and *France* agreed to yield the poſſeſſion of the country. Some *Africans* who were on board a ſhip ſtranded on the coaſt, obtained a ſettlement on the iſland, and having a number of women in their company, they ſoon increaſed greatly. A mixed race ſprang from theſe people and the former inhabitants; ſo that a difference of colour prevails, which has occaſioned theſe ſavages to be diſtinguiſhed by the different appellations of the black and red *Caribs*.

By the treaty of peace in 1763 the right to this iſland was, by the contracting parties, veſted in the *Engliſh*. The *Caribs* were then ſuppoſed to amount to one thouſand fighting men. Theſe poſſeſſed the windward ſide of the iſland; ſeveral *French* planters had ſettled to the leeward. The *Abbé Raynal* informs us, that eight hundred white men and three thouſand blacks were employed in cultivating theſe plantations; and the annual amount of the productions exported, was 5,625*l.* ſterling. After the peace commiſſioners were appointed for the ſale of the profitable lands in thoſe iſlands; but the *French* ſettlers were permitted to hold their poſſeſſions upon leaſes for years, and under certain ſtipulations. A great number of the *French*, not chooſing to live under *Engliſh* government, abandoned their eſtates, which, together with the new lands, were generally purchaſed by adventurers from *Great Britain*; by which the *Engliſh* ſettlers on the iſland ſoon became conſiderable both from numbers and property. Early directions had been given by the miniſtry, that the *Caribs* ſhould not be diſturbed in the poſſeſſion of their lands; but ſome rapacious planters, beholding with a jealous eye the poſſeſſions of theſe natives, repreſented to government at home the danger to which the colony would be expoſed, if ſo numerous, warlike, and enterprizing a ſet of men, who were ſtrongly attached to the *French* intereſt, ſhould be permitted to continue on the iſland. At length an order was iſſued for tranſporting theſe *Caribs* to the coaſt of *Africa*, with directions for a ſettlement being procured for them there, and that they ſhould be provided with every thing neceſſary and convenient for the eſtabliſhment of a colony. This arbitrary proceeding was ſtrongly oppoſed by theſe *Indians*, the ſcheme of tranſportation was laid aſide, a body of troops was landed on the iſland, and a war was waged to drive theſe people into a more narrow and leſs fruitful diſtrict. The *Caribs* at length propoſed terms of accommodation; they ceded a very large tract of valuable land to the crown, in return for which, the diſtricts which they continued to hold, were ſecured to them and their poſterity in perpetuity, and made unalienable to any white perſon. The loſs on our ſide, in this expedition, amounted to one hundred and fifty men, killed and wounded; among which was a lieutenant-colonel, and ſome other officers; one hundred and ten were carried off by ſickneſs, and upward of four hundred remained ſick at the concluding the treaty.

Ever ſince the *Engliſh* became poſſeſſed of this iſland, they have directed all their attention to the cultivation of ſugar, but in the year 1779, the count *d'Eſtaing* made a deſcent, and obliged the governor to capitulate. It was reſtored to *Great Britain* by the treaty of peace in the year 1783.

The cuſtom houſe duties collected on the iſland of *St. Vincent*, in the year 1784, proved an expence to the public of 86*l.* ſterling, after 235*l.* had been paid in ſalaries, and 240*l.* in incidental expences.

BARBADOES.

THIS iſland, the moſt conſiderable and moſt windward of the *Caribbee* iſlands, extends from 13° 3′ to 13° 35′ N. latitude, and from 58° 35′ to 58° 47′ W. longitude from *Greenwich*: ſtretching in its greateſt length from *Goulding's-green*, in *St. Lucy's* pariſh, to *Ananias-point*, in *Chriſt-church* pariſh, thirty miles; and its greateſt breadth from *Kirtridge's-point* in *St. Phillip's* pariſh, to a point in *St. James's* pariſh, about twenty miles; and the circumference of the whole iſland from ſome of the ſurrounding principal points, is almoſt fifty-four ſtatute miles. An extenſive reef of rocks runs from the S. point of the iſland eaſtwardly to the N. W. in which direction it is inacceſſible to ſhips of fifty tons burden; the other part of the coaſt has been fortified at a very great expence, the repairing and maintaining of which occaſions a great annual charge.

Its firſt appearance to the ſea eaſtward is ſomewhat hilly, but to the S. W. and the N. W. is more level. The ſurface in general appears covered with an agreeable verdure, variegated with lofty trees and large buildings, affording many beautiful proſpects. The higheſt part of the iſland is a rocky cliff, whoſe perpendicular altitude is nine hundred and fifteen feet above high-water mark.

The atmoſphere is in general ſerene, clear, and ſeldom cloudy; the air is in general very healthy, which is chiefly owing to the regularity of the trade winds, and to its having neither bogs nor marſhes, in which the ſtagnated waters being exhaled to vapours, might prove pernicious; nor large foreſts, which not only obſtruct the paſſage of the winds, but generate a moiſt air. The thermometer ſeldom riſes above 88, or ſinks lower than 72. In an account given of this iſland in the year 1768, the author ſays, "the natives enjoy good health, and frequently live to a very old age. There were living on this iſland, a few years ago, within ſix miles of each other, five men, whoſe ages together exceeded four hundred years, and there lately died a gentlewoman at the very advanced age of one hundred and ten years, who had always reſided upon the iſland." *Short Hiſtory of Barbadoes*, p. 128.

The ſoil of *Barbadoes* is in general fruitful, but very different in different parts of the iſland: in the low deep lands it is chiefly black, in ſhallower parts ſomewhat reddiſh, on the hills frequently of a whitiſh, chalky, and marly nature, and near the ſea it is generally ſandy. Where the ſoil is black, as it imbibes the rays of the ſun and reflects few or none, the circumambient air is not near ſo hot as where the ſoil is ſandy or gravelly. As the fertility of this, as well as others of the *Weſt India* iſlands, depends upon ſeaſonable rains, a long chain of hills, interſperſed with deep vallies, are providentially ſituated to the eaſtward of ſome parts of the iſland, to intercept the clouds and vapours. Hence that part of the iſland called *The Thickets*, in *St. Phillip*'s pariſh, being low land, and having no hills or high cliffs to the eaſtward, to ſtop the progreſs of theſe clouds, is often ſcorched with drought, when the middle and more hilly parts of the iſland are repleniſhed with rain.

It ſometimes happens that large pieces of ground planted with canes, and even land with plantain and banana-trees growing upon it, have ſlid down to the vallies from the ſides of the hills. This happens in very rainy ſeaſons; for as the ſoil upon theſe hills is commonly not above eight or nine inches deep, and of an oozy and ſopy nature underneath, it eaſily ſeparates from the next immediate ſubſtratum, which is of a ſlippery chalk, flat ſtones, or looſe gravel. See an account of ſimilar appearances in *Calabria*, page 406, and in *Solway Moſs* in *England*, page 585 of this volume.

The beautiful proſpects from ſeveral hills over the vales below is quite enchanting; particularly *Hackleton's-cliff*, where nature at one view diſplays a great variety of ſurpriſing landſcapes. Here the high impending rocks yield a dreary rueful appearance: the ſeveral deep chaſms below, over which they project, are imbrowned with the thick foliage of lofty trees. The adjacent ſteep declivity conſiſts of irregular precipices and broken rocks, the whole view terminating on the ſea, over whoſe craggy ſhores the foaming waves inceſſantly break. The view appears ſolemnly awful, except when the eye is relieved by a glimpſe, or ſometimes a full view of the neighbouring plantations. To complete this uncommon contraſt, a deep rapid river runs through the vallies at the bottom of theſe precipices; which, though in the dry ſeaſon it is almoſt without water, yet in the rainy months of June, July, and Auguſt, it often overflows its higheſt banks. The public roads on this iſland are remarkably bad.

The iſland abounds with caves, the moſt remarkable of which, called *Cole's-cave*, is ſituated almoſt in the bottom of a melancholy hideous gully, or a deep chaſm made between hills by repeated torrents of rain. This gully is about a hundred and ſixty-five feet deep, from whence you can ſee nothing above you but the tops of high rocks and impending cliffs, through the branches of lofty trees. The deſcent toward the entrance of this cave is by a ſteep craggy precipice of great height, where your ſecurity from falling depends much upon the good hold you take of the roots of trees and branches of underwood. Having rather ſlid than walked down in this manner a conſiderable way, you are ſuddenly within an incloſure of very high perpendicular rocks, where the light of the ſky is admitted by two holes in the roof. On the W. ſide of this gloomy apartment lies the mouth of the cave, which is of conſiderable ſize. Upon your firſt entrance into it the light of the day begins to grow weak, and proves but an uncertain guide. Twenty yards farther it appears no ſtronger nor brighter than the glimmering of a ſtar in a dull hazy night, and a few ſteps more envelops you in total darkneſs. It extends about a quarter of a mile from its entrance; is in no part very lofty, but is divided into different apartments: through it runs a ſpring of clear water.

The iſland has ſeveral ſprings, and a few rivulets, particularly two ſtreams, one in the E. and the other in the S. W. The inhabitants of *St. Andrew*'s, and ſome part of *St. Joſeph*'s pariſh, are plentifully ſupplied with freſh water, by digging holes in the ſand, from ten inches to three feet deep; and theſe are almoſt inſtantly ſupplied with freſh water, percolated through the ſand; but in other parts the inhabitants are obliged to preſerve rain water in reſervoirs, which are generally dug near a deſcent.

In the centre of the iſland are ſeveral bituminous ſprings; ſome of which furniſh the green tar, which is applied to medical purpoſes, and frequently ſupplies the want of pitch and lamp oil.

There is another ſpecies of bitumen of a ſolid ſubſtance, called here *munjac*, which is dug out of the earth, at different depths on the ſides of hills in *St. John*'s and *St. Andrew*'s pariſhes, and nearly reſembles that bitumen found in the *Dead Sea*. If by accident any of theſe veins take fire, they continue to burn a long time, though in a dull ſlow manner; for the veins being ſurrounded with earth, it crumbles, and falling into the flame, ſtifles it.

In *St. George*'s pariſh are often dug up lumps of a tranſparent reſinous ſubſtance reſembling reſin, from which it is chiefly diſtinguiſhed by the fragrance of its ſmell; and upon comparing it with the gum of the birch gum-tree, it appears to be of the ſame ſpecies.

The Vegetables and Animals of BARBADOES.

THE trees of *Barbadoes* are vaſtly numerous; that called the *palm-oil-tree* grows about fifty feet high; its branches ſomewhat reſemble thoſe of the cabbage-tree, but are much leſs uniform, ſhorter, and leſs verdant: the middle rib of each leaf is thickly ſtudded with ſharp-pointed prickles, each two inches long. The fruit is incloſed in a pod, which opening expoſes to view many ſmall nuts covered wirh a huſky tegument of a yellowiſh colour, containing in its many interſtices, when ripe, a conſiderable quantity of fine ſweet oil, which the ſlaves, after the whole fruit is firſt roaſted in the embers, greedily ſuck.

The *burgamot-tree* reſembles that of the orange, but the fruit is ſomewhat larger: it has, however, very little juice, and what it yields is exceeding ſour: its oil is moſt valued: this is extracted by ſlicing the outward ſkin, and ſqueezing the fruit into a glaſs, when the oil immediately ſeparates from the juice, and ſwims upon the ſurface. This being carefully drained off and preſerved, is what alone ought to be called the genuine burgamot-oil. The *Portugueſe* make ſnuff-boxes of the rind, which retain for a long time the grateful fragrance of the oil.

What is here called *the forbidden-fruit-tree* has the trunk, leaves, and flowers, like thoſe of the orange. The fruit, when ripe, is ſomething larger and longer than the fineſt orange, which it alſo exceeds in its delicious taſte and flavour.

Here are alſo the *ſour orange*, the *Guinea orange*, the *golden orange*, ſo called from its being of a deep yellow within; the *ſhaddoc*, the *citron*, the *St. Helena lemon*, the *Spaniſh lemon-tree*, and the *lime*; the *pomegranate* and the *guava-tree*.

Beſide the trees already mentioned, there are the *pine-apple*, and a great variety of other fruits, with many trees admired for the beauty and ſolidity of the wood, particularly *lignum vitæ*, *red wood*, *iron wood*, and many others; we ſhall only add the following, which is one of the moſt remarkable of the *American* trees, and is found in moſt of the *Caribbee Iſlands*, as well as at *Barbadoes*.

The *manchaneel-tree* is remarkable for the beauty of the timber, and its juice being one of the ſtrongeſt poiſons yet diſcovered. Hiſtorians have, however, exaggerated the accounts they have given of the poiſonous nature of this tree; for it has been ſaid, that the heads of the perſons who ſleep under its ſhade ſwell, and they become blind; that if the leaves touch but the naked ſkin, they raiſe puſtules, which cauſe deadly pains, unleſs helped with water and ſalt, or faſting ſpittle. This, however, is not true; nor is any ill conſequence to be feared from the leaves touching the naked body, unleſs they are bruiſed, and the white milky juice they contain is ſuffered to pervade the pores; when it does, it raiſes bliſters like thoſe of the confluent kind of the ſmall-pox, cauſing acute pains; but ſimple drops of rain water falling from thoſe leaves upon the ſkin will not have any bad effect, which Mr. *Hughes* ſays he has experienced upon repeated trials.

This tree is of a very quick growth, and is ſeldom or never found growing to any perfection but in a looſe and ſandy ſoil, near the ſea or other water. The trunk, when full grown, is generally from two feet and a half to three feet in diameter, branching, moſt commonly, from three to fifteen feet high from the ground. The grain is ſmooth, and the wood durable. It bears a fruit of the ſame make as the round ſort of crab-apple, and is of a beautiful colour and fragrant ſmell. The pulp of theſe manchaneel apples does not exceed one-ſeventh of an inch in depth, the inſide being a hard ſtony kernel, in which are included the ſeeds. Formerly no one dared to cut down theſe trees, without firſt having made a large fire round them, in order to burn the bark and dry up the juices that proceed from them in cutting: but now naked negroes venture to cut them down, only uſing the precaution of rubbing their whole bodies with lime-juice, which prevents the ſap from corroding or ulcerating their ſkins. Bruiſing and maſhing the tender leaves and boughs, and then throwing them into fiſh-ponds, has often been practiſed by villains to deſtroy the fiſh, which ſoon after grow ſtupid, float with their bellies upward on the top of the water, and frequently die. Some ſorts of fiſh will eat theſe apples; theſe are often found dead in the water, and if taken while alive and eaten, often prove poiſonous; even the large white crab that burrows in the ſand, is not, if near theſe trees, to be uſed for food. It is extremely remarkable that whereever a manchaneel-tree grows, there is found either a white wood, or a fig-tree near it, the juice of either of which is an infallible antidote againſt the poiſon; ſalt water is no leſs efficacious; and as theſe trees grow by the ſea-ſide, this remedy is alſo near at hand.

Among the vegetables of a lower growth, are *Guinea* and *Indian* corn, and a vaſt variety of plants, the moſt valuable of which is the *ſugar-cane*, and many medicinal herbs.

With reſpect to the animals, the ſheep bred here are, as in the other *Caribbee Iſlands*, hairy like goats. This want of wool is abundantly ſupplied by the *cotton-tree*, of theſe there are here ſeveral ſorts, which annually ſupply the inhabitants with the fineſt wool in the world.

They have *aſſes*, which are of extraordinary uſe, becauſe they can carry burdens where horſes cannot paſs.

There are here but three ſpecies of reptiles that can be properly called venomous, the *black-ſpider*, the *forty-leg*, and the *Surinam ſcorpion*.

A full grown *ſcorpion* of the common ſort is about ten inches long, the ſkin ſoft but ſcaly, and of a dull copper colour. Mr. *Hughes* obſerves, that the very young ones are ſurpriſingly preſerved from danger; for when this threatens, the parent ſcorpion opens her mouth and ſwallows them, and afterward voids them when the danger is over.

The *Surinam* ſcorpion is, however, only three inches in length from the head to the extremity of the tail. From the fore-part of the neck riſe two claws, about three quarters of an inch long, divided into three joints, each claw near its extremity ending in a long, ſlender, whitiſh forceps. It has two eyes, which are black, ſmall, and ſhining, with four pair of legs, the hindermoſt being the longeſt: each joint of the legs, as well as the back, is marked with ſeveral faint whitiſh ſtripes, the intermediate ſpace being of a ruſſet colour mixed with blackiſh ſpots. The tail is divided into ſix joints, and at the extremity of the laſt appear two ſmall horny crooked ſtings, in the form of a wide extended forceps, the upper being double the length of the lowermoſt: the longeſt coming from the upper ſide of the laſt joint of the tail, the other from the lowermoſt part, the intermediate ſpace being fleſhy. When this ſcorpion walks or runs, it generally curls up its tail in a ring, and when provoked, extends it to its full length, and with a quick motion darts it into its adverſary. Thoſe who have the misfortune to be ſtung by them endure very acute pain for ſeveral hours, and the fleſh near the wound generally turns livid; but the wound is not mortal. Theſe ſcorpions are chiefly to be found among old boards, old books, or other looſe papers. They bear young only once in their life: the female carries her young upon her back, and as theſe grow in ſtrength the parent decays and dies.

Monkies are not very numerous in this iſland; they chiefly reſide in inacceſſible gullies, eſpecially where there are many fruit-trees. They do great miſchief to the neighbouring planters, by digging out of the earth yams and potatoes, and ſometimes breaking and carrying off the ripe ſugar-canes. But, as a premium is given for deſtroying both theſe and the racoons, they rather decreaſe than multiply.

The moſt deſtructive quadrupeds, with reſpect to the ſugar-canes, are the rats, which are ſo numerous, that the annual loſs to the inhabitants of the pariſhes of *St. Joſeph* and *St. Andrew* alone, has been computed at no leſs than two or three thouſand pounds.

The birds of this iſland are not very numerous; there are none of them remarkable for their notes, nor for the beauty of their feathers, excepting the *humming-bird*. The tame fowls are much the ſame as thoſe in *England*; beſide which they have the *Guinea* fowl, *Muſcovy* ducks, and rumpleſs fowls.

The ſhores afford a great variety of ſhell-fiſh, ſome of which are exceedingly beautiful, and a variety of marine productions.

Among the more extraordinary kinds of fiſh are the *flying-fiſh*, the *toad-fiſh*, the *ink-fiſh*, which is ſo called from its diſcolouring the water with a black liquid when in danger of being caught, by which means it becomes inviſible to the enemy; the *cat of nine-tails*, and the *ſcuttle-fiſh*, the two latter, as well as the ink-fiſh, eject a black liquid; the *old-man*, the *old-wife*, the *dolphin*, the *mud-fiſh*, the *ſtar-fiſh*, and the *ſhark*. This laſt fiſh we have already deſcribed in the courſe of this work; but we cannot forbear mentioning a very unequal and hazardous combat with that voracious animal by a common ſailor, which is perhaps as heroic an inſtance of diſintereſted friendſhip and perſonal bravery as any recorded in hiſtory. The account we find in Mr. *Hughes*'s *Natural Hiſtory of Barbadoes*, and ſhall give it in his own words.

“ About the latter end of queen *Anne*'s wars, Captain *John Beanis*, commander of the *York Merchant*, arrived at *Barbadoes* from *England*. Having diſembarked the laſt part of his lading, which was coals, the ſailors, who had been employed in that dirty work, ventured into the ſea to waſh themſelves; there they had not been long, before one on board eſpied a large ſhark making toward them, and gave them notice of their danger; upon which they ſwam back, and all reached the boat, except one; him the monſter overtook almoſt within reach of the oars, and griping him by the ſmall of his back, ſoon cut him aſunder, and as ſoon ſwallowed the lower part of his body; the remaining part was taken up and carried on board, where a comrade of his was; whoſe friendſhip with the deceaſed had been long diſtinguiſhed by a reciprocal diſcharge of all ſuch endearing offices, as implied an union and ſympathy of ſouls. When he ſaw the ſevered trunk of his friend, it was with an horror and emotion too great for words to paint. During this affecting ſcene the inſatiate ſhark was ſeen traverſing the bloody ſurface in ſearch of the remainder of his prey; the reſt of the crew thought themſelves happy in being on board, he alone unhappy, that he was not within reach of the deſtroyer. Fired at the ſight, and vowing that he would make the devourer diſgorge, or be ſwallowed himſelf in the ſame grave, he plunges into the deep, armed with a ſharp-pointed knife. The ſhark no ſooner ſaw him, but he made furiouſly toward him; both equally eager, the one of his prey, the other of revenge. The moment the ſhark opened his rapacious jaws, his adverſary dexterouſly diving, and graſping him with his left hand ſomewhat below the upper fins, ſucceſsfully employed his knife in his right hand, giving him repeated ſtabs in the belly; the enraged ſhark, after many unavailing efforts, finding himſelf overmatched in his own element, endeavoured to diſengage himſelf, ſometimes plunging to the bottom, then mad with pain, rearing his uncouth form, now ſtained with his own ſtreaming blood, above the foaming waves. The crews of the ſurrounding veſſels ſaw the unequal combat, uncertain from which of the combatants the ſtreams of blood iſſued; till at length the ſhark, much weakened by the loſs of blood, made toward the ſhore, and with him his conqueror; who, fluſhed with an aſſurance of victory, puſhed his foe with redoubled ardour, and, by the help of an ebbing tide, dragged him on ſhore, ripped up his bowels, and united and buried the ſevered carcaſs of his friend."

THE five precincts of this iſland, with their eleven pariſhes, are as follow.

In the S. part of the iſland are *St. Michael's*, or *Bridge* precinct, containing the pariſhes of *St. Michael*, *St. George*, and *St. John*. In *St. James's*, or the *Hole* precinct, are the pariſhes of *St. Thomas* and *St. James*; and in *St. Peter's*, or *Speight* precinct, is the pariſh of *St. Peter*, with *All Saints'* chapel.

In the E. part is *Oſtine's* precinct, which contains the pariſhes of *Chriſt Church* and *St. Philip's*.

In the N. is *St. Andrew's Overhill*, or *Scotland* precinct, which contains the pariſhes of *St. Andrew* and *St. Joſeph*.

A judge and four aſſiſtants preſide in each precinct.

In the W. is only the pariſh of *St. Lucy*.

BRIDGE TOWN, the capital, is reckoned the fineſt and the largeſt town in all the *Caribbee Iſlands*. It is ſeated in the S. W. part, in 13°. 5'. N. latitude, and in 58°. 35'. W. longitude from *Greenwich*; and was at firſt called *St. Michael's*, from the name of its church; but received its preſent denomination from a bridge erected over the waters, that, after rains, flow from the neighbouring marſhes. It is ſituated in the innermoſt part of *Carliſle* bay, which is large enough to contain five hundred ſhips. The houſes, which were of brick and ſtone, were lofty, the ſtreets broad, and one of them, named *Cheapſide*, had the rents as dear as thoſe of the houſes of *Cheapſide* in *London*. The wharfs and quays are very neat and convenient, defended by ſeveral forts. The firſt to the W. is *James* fort, which is mounted with eighteen guns: the next is *Willoubby's*, built on a ſmall neck of land that runs out into the ſea, and is mounted with twenty guns: there are three batteries between this and *Needham's* fort, which is alſo mounted with twenty guns. Above *Needham's*, and more within land, is the Royal citadel, called *St. Anne's*. *Charles* fort is build on *Needham's* point, and lies out in the ſea to the windward of the bay and town. From this a platform runs to *Ormond's* fort. On the E. ſide of the town is a ſmall fort of eight guns, and a magazine built of ſtone, where the powder and ſtores of the iſland are kept under a ſtrong guard. In the year 1766 two deſtructive fires cauſed great devaſtation in this town, which, at that time, conſiſted of about fifteen hundred dwelling-houſes and ſtores. It has been ſince rebuilt in an elegant and uniform manner.

The church, which is as large as any of our cathedrals, has a noble organ, a good ring of bells, and a curious clock. In the town are alſo large taverns and eating-houſes, with a poſt-houſe, packet boats being eſtabliſhed by the government to carry letters monthly to and from this place. This is the ſeat of the governor, council, and aſſembly, and alſo of the court of *Chancery*. The number of militia for this town and *St. Michael's* precinct is no leſs than twelve hundred men, who are called the Royal regiment of foot guards. There is here a college founded and well endowed by the liberality of that great man Colonel *Chriſtopher Codrington*, who was a native of this iſland, and was diſtinguiſhed by a great number of amiable and uſeful qualities. The town has alſo a convenient free-ſchool, and an alms-houſe for twenty poor widows.

There are three other towns of ſmaller note, called *Oſtin's*, *St. James's*, and *Speight's*: indeed every part of the iſland is ſtrewed with gentlemen's houſes, encompaſſed by fields of ſugar-canes, and the bloom and fragrance of orange, lemon, lime, and citron-trees, guavas, papas, aloes, and a vaſt multitude of other elegant and uſeful plants. Even the negro huts, though mean, contribute to the beauty of the country, being ſhaded with plantane-trees, which give thoſe villages the appearance of ſo many beautiful groves.

In *St. John's* pariſh, a few miles from *Bridgetown*, is a college for the education of youth, and a very large eſtate, capable of yielding 3000*l.* ſterling per annum, was bequeathed by Mr. *Codrington*, to ſupport this charitable inſtitution.

The government of *Barbadoes* conſiſts of a governor, who is appointed by the king; a council, compoſed of twelve members, alſo ſo appointed; and an aſſembly of twenty-two freeholders, choſen by the freeholders in the ſeveral pariſhes, each pariſh returning two; theſe laſt are elected annually; they chooſe their ſpeaker, who with eleven members form a houſe. The governor is the repreſentative of the crown; he is commander in chief, chancellor, ordinary, and vice-admiral of the iſland. The members of the council, as privy-counſellors, adviſe and aſſiſt the governor: they, as part of the legiſlative body, form the upper-houſe, and in paſſing all laws act as the houſe of peers in *Great Britain*.

The governor and the members of council conſtitute the court of Chancery. The governor, as chancellor, grants adminiſtrations of inteſtates effects, and probates of wills: he has the power of appointing and removing all military officers; of adjourning or diſſolving the houſe of aſſembly, and of putting a negative upon all bills; but he cannot appoint judges of the courts, juſtices of the peace, or remove a judge, or member of the council, except with the concurrence of the council, given by a majority of voices.

The members of the council, whilſt reſident on the iſland, are ſtyled "honourable," and precede baronets; cuſtom has alſo given the title of "excellence" to the governor, who has a ſalary of 2000*l.* ſterling per annum, payable out of the four and half per cent. duty; he is likewiſe entitled to a third of all ſeizures, but is reſtricted from receiving any preſent from the aſſembly, unleſs as a ſettlement made by the firſt aſſembly he meets after his arrival: of late years ſuch ſettlement has been 3000*l.* per annum currency. The governor nominates the rector of each pariſh on the iſland, the income of which, as eſtabliſhed by law, is 150*l.* per annum, excluſive of preſents and parochial fees.

Here is in general a greater appearance of order and decency than in any other colony in the *Weſt Indies*; and there is no place comparable to *Barbadoes*, in the number of the people, the cultivation of the ſoil, and thoſe elegancies and conveniences which reſult from both. The white inhabitants on this iſland were, in the year 1768, computed at 22,000, and the ſlaves at 72,000. *Account of Barbadoes*, p. 122.

The iſland can raiſe five thouſand men of its own militia, and has generally a regiment of regular troops, though it is ſeldom complete. It is fortified all along the windward ſhore by rocks and ſhoals; ſo that near two-thirds of that coaſt is utterly inacceſſible. On the leeward ſide it has good harbours; but the whole coaſt is protected by a line drawn ſeveral miles in length, and by caſtles, forts, and twenty-ſix batteries. All freemen here are obliged to enter themſelves in the regiment of their own diſtrict, and there is a law obliging all perſons who deſign to leave the iſland to give notice of it, at the ſecretary's office, three weeks before their departure.

The annual internal expence of *Barbadoes* is ſtated to be 16,000*l.* currency; and the ſame writer ſuppoſes that four hundred ſhips, of one hundred and thirty tons and upward each, are employed in the trade of the iſland, and that the exports from *Great Britain* alone, brought into this iſland, in certificate goods, *Britiſh* produce and manufactures, is about 80,000*l.* per annum. The exports from *Ireland* are likewiſe conſiderable.

Sugar is the chief article of exportation from *Barbadoes.* The cultivation and making of it was brought to a tolerable degree of perfection in this iſland, ſo early as the year 1650; the inhabitants having been taught the art of making it by the *Dutch.* The ſugar-cane was firſt brought hither from *Fernambucca,* in *Braſil.* *Tobacco* was planted in this iſland before the ſugar-cane. Beſide *rum* and *molaſſes*; *ginger* and *cotton* are exported from this iſland in conſiderable quantities.

There are four ports on this iſland at which duties on merchandize are received, *viz. Bridgetown, Oiſtins, Holetown,* and *Speights*; from all theſe no revenue is drawn adequate to the charges. The ſalaries paid at *Bridgetown,* in the year 1784, amounted to 1,355*l.* ſterling, and the incidental expences to 221*l.* ſterling, and 220*l.* currency, whilſt the receipts were only 553*l.* The expences of the cuſtoms at the other ports, in ſalaries and incidents, amounted to 459*l.* ſterling, and 91*l.* currency, whilſt no receipts were brought to account. *Fifteenth Report of the Commiſſioners, &c. Appendix, No.* 25 *and* 26.

Hiſtory of BARBADOES.

IT is not certainly known when this iſland was firſt diſcovered and ſettled, but it is probable that it was between the year 1615 and 1624. The difficulty of preciſely fixing the time is cauſed by the loſs of many records, in a very deſtructive fire which broke out at *Bridgetown,* in the year 1668, but ſome papers were ſaved, which were afterward printed, and by them it appears, that an *Engliſh* ſhip, named *Olive,* homeward bound from *Guiana,* fell in with this iſland, and landed ſome men, who ſet up a croſs, near to where *St. James's* town was afterward erected, and left inſcribed on a tree, "*James* king of *England,* and this iſland." Afterward, about the year 1624, it appears from many authentic accounts, that a ſhip belonging to Sir *William Courteen,* then one of the moſt conſiderable merchants of *London,* touched at this iſland; about thirty of the crew landed, and formed a ſettlement, on the weſtern ſide; but they found the country uninhabited, and overgrown with thick woods. The account which this ſhip brought, induced Sir *William Courteen,* and ſome others, to fit out two ſhips with all kinds of neceſſaries for planting and fortifying the iſland; but the deſign was no ſooner known than *Hay,* earl of *Carliſle,* whom the author of the account of the *European* ſettlements in *America* ſtyles, "a very unworthy and unfaithful favourite," ſolicited and obtained a grant from the crown, of all the *Caribbee Iſlands.* The earl being appointed to a foreign embaſſy, *Courteen,* through the interpoſition of the earl of *Pembroke,* obtained from *Charles* I. a grant of the iſland of *Barbadoes*; but on lord *Carliſle's* return to *England,* he procured the grant to lord *Pembroke* to be annulled in the year 1629.

The firſt planters had not only the deſolateneſs of the place and the extreme want of proviſions to ſtruggle with, but the trees were generally ſo large, of a wood ſo hard and ſtubborn, with wide ſpreading tops, that they proceeded in the neceſſary work of clearing the ground with a difficulty that muſt have ſubdued any ordinary patience; and even when they had tolerably cleared a ſmall ſpot, the firſt produce it yielded for their ſubſiſtence, probably for want of ſowing the ſeed in a proper ſoil, was ſo ſmall and ordinary, at the ſame time their ſupplies from *England* were ſo ſlow and precarious, that nothing but an invincible courage, and a firmneſs that cannot be ſufficiently commended, could have carried them through the diſcouragements they met with in the noble work of cultivating and peopling a deſerted part of the earth. By degrees things wore a more favourable aſpect; ſome of the trees yielded fuſtic for the dyers; cotton and indigo were found to agree well with the ſoil; tobacco then becoming faſhionable in *England,* anſwered tolerably; and the country gradually began to ſubmit to culture, and to lay aſide its ſavage appearance.

This colony, notwithſtanding the difficulties it had to ſtruggle with, increaſed ſo faſt, that it was computed there were 20,000 white men upon this iſland in the year 1650, and that 10,000 foot and 1000 horſe could be muſtered for its defence. The governor then appointed a council to conſiſt of ten members, and an aſſembly, to repreſent the people. He alſo divided the iſland into four circuits, and eleven pariſhes.

During the time of the *Commonwealth,* Sir *George Aſcue* attacked this iſland, having on board his fleet 2000 land forces, and obtained the ſurrender of the iſland to the parliament of *England,* granting the planters, and inhabitants in general, every thing they aſked.

The conqueſt of *Jamaica* tended very much to leſſen the conſequence of *Barbadoes.* It is ſaid by a well informed writer, that the *Barbadians* furniſhed 3500 ſoldiers in the expedition under *Penn* and *Venables,* in which that conqueſt was effected. *Short Hiſtory of Barbadoes,* p. 18.

Soon after the reſtoration, *Charles* II. compounded with the heirs of the earl of *Carliſle* for the ſurrender of the patent of the *Caribbee Iſlands.* Being thus become immediately ſubject to the crown, a duty of four and a half per cent. on the dead commodities of the produce of the iſland which are ſhipped from it was laid, and the ſame was extended to all the other *Caribbean Iſlands* which had been poſſeſſed by the earl of *Carliſle*; they were *Antigua, St. Chriſtopher's, Nevis, Montſerrat,* and *Tortola.* In the year 1664, *De Ruyter,* the *Dutch* admiral, made an attempt upon *Barbadoes,* but he was compelled to retire. Ten years after the inhabitants were reckoned to amount to 50,000 white men, and 70,000 blacks, or ſlaves; a number apparently incapable of being ſupported on ſo ſmall an iſland: but this proſperous ſtate was not long to continue, for on the thirty-firſt of *Auguſt,* 1675, the iſland was afflicted with a moſt dreadful hurricane, which, it is ſaid, was not inferior in its deplorable conſequences to the earthquake that happened at *Jamaica*; for it left not a houſe or tree ſtanding except the few that were ſheltered by ſome neighbouring hill or cliff.

This dreadful calamity happened in the meridian of this ſettlement, when four hundred ſail of ſhips, one with another, of a hundred and fifty tons, were employed in their trade. Their annual produce, conſiſting of *ſugar, indigo, ginger,* exported *cotton,* &c. amounted to upward of three hundred and fifty thouſand pounds, and their circulating caſh at home was two hundred thouſand. Perhaps no country in the world was ever peopled in the ſame proportion; nor has land of the ſame dimenſions which produces any thing like the ſame profits. But ſince that time the iſland has been upon the decline. The growth of the *French* ſugar iſlands, and the ſettlements of *Antigua, St. Chriſtopher's, Nevis,* and *Montſerrat,* as well as the greater eſtabliſhment in *Jamaica,* have drawn away a vaſt number of the people. A terrible contagion attacked the iſland in the year 1692; it raged like a peſtilence; twenty perſons frequently died in a day in their principal town, and all parts of the iſland ſuffered in proportion. This ſickneſs continued, with ſome abatements, for ſeveral years, and is ſaid to have rendered the climate leſs healthful than it was before.

On the 10th of October, in the year 1780, a moſt dreadful hurricane, from the N. W. did prodigious miſchief on this iſland.

GRANADA, *and the* GRANADILLAS, *or* GRANADINES.

THE chief of theſe iſlands, named GRANADA, or GRENADA, is ſituated from 11°. 55′. to 12°. 23′. N. latitude, and in 61°. 40′. W. longitude. It is the laſt of the *Windward Caribbees,* and lies thirty leagues N. of *Cumana,* on the continent of *South America*; and about thirty leagues N. W. of *Tobago.* It is ſaid to be about thirty miles in length, in ſome places fifteen in breadth, and about ſixty-ſix in circumference.

Granada and the *Granadines* produce very fine timber; the latine-tree, which grows here, has a tall body, and its leaves, when tied together, ſerve as a thatch for houſes: the ſoil of this iſland is ſuited to produce *ſugar*, *tobacco*, and *indigo*; and ſince it has been in poſſeſſion of the *Engliſh* its cultivation has improved very rapidly.

A lake on the top of a high hill, in the middle of the iſland, ſupplies it with ſtreams of freſh water, which render the ſoil extremely fertile, and it abounds with wild game; among the fowl are wood-pigeons, thruſhes, and parrots; and among the fiſh are eels, mullets, and cray-fiſh.

Several bays and harbours lie round the iſland, ſome of which might be fortified to great advantage: ſo that it is very convenient for ſhipping, and has the happineſs of not being viſited by hurricanes. The chief port, called *Lewis*, is on the W. ſide; it is very ſpacious, and lies in the middle of a large bay.

The *French* became maſters of this iſland by diſpoſſeſſing the original inhabitants, whom they treated with the moſt inhuman ſeverity and cruelty, and at length effected their extirpation, but not without great loſs on their ſide, for the conteſt was bravely maintained by the *Caribs*. The *French* held poſſeſſion of the iſland for about a century, but without deriving any conſiderable advantages from its kindly ſoil and propitious climate.

In the year 1762 this iſland was reduced by the *Engliſh*; the *French* inhabitants, who were not very numerous, were ſo amazed at the reduction of *Guadaloupe* and *Martinico*, that they loſt all ſpirit, and ſurrendered without making the leaſt oppoſition. Afterward the full property of this iſland, and of the *Grenadines*, which bear nearly the ſame products as *Grenada*, were confirmed to the crown of *Great Britain* by the definitive treaty of 1763; they were then ſettled by the ſubjects of *Great Britain*; but in the year 1779, the iſland was conquered by the *French* under the count *d'Eſtaing*. Lord *Macartney*, the *Engliſh* governor, diſliking the terms of capitulation propoſed, reſolved on defending the iſland; but the poſt which he occupied being taken by aſſault, all the valuable effects which had been there collected, fell into the hands of the victors, who had thereby the abſolute diſpoſal of the perſons and properties of the *Engliſh* on the iſland. It was reſtored to *Great Britain* by the peace of 1783.

The ſtate of the cuſtoms, at the two ports of *St. George* and *Grenville* harbour, on the iſland of the *Granades*, in the year 1784, appears to have been; ſalaries at *St. George*'s 375*l.* ſterling, incidental expences 10*l.* ſterling, and 360*l.* currency; deficiency upon the balance of receipts and payments 156*l*: ſalaries at *Grenville* harbour, 375*l.* incidents 125*l.* deficiency on balance 52*l.*

TORTOLA.

ONE of the *Virgin Iſlands*, is a ſmall ſpot which was included in the grant made by *Charles* I. to the earl of *Carliſle*, and when all the iſlands comprehended in that grant were purchaſed by the crown in the next reign, a duty of four and an half per cent. on its productions, when exported, was impoſed on this iſland, as well as upon the other five. A cuſtom-houſe is eſtabliſhed here, which appears to have ſubjected the public revenue to an expence of 125*l.* ſterling, in ſalaries, and 176*l.* in incidental charges, in the year 1784, without producing any receipts.

SECT. II.

The Iſlands poſſeſſed by *France* in the *Weſt Indies*.

HISPANIOLA, *or* ST. DOMINGO.

THIS iſland was diſcovered by *Columbus* in his firſt voyage in 1492, and by him called *Eſpagniola*, or *Hiſpaniola*: but afterward building a city, which he called *St. Domingo*, in honour of his father *Dominic*, the name was firſt extended to that quarter, and at length the whole iſland was called *St. Domingo*, by which name it is as well known as by that of *Hiſpaniola*.

This iſland, part of which belongs to the *Spaniards*, is next to *Cuba*, the largeſt of all the *Antilles*, being about four hundred and twenty-ſix miles from E. to W. and almoſt one hundred and twenty-four where broadeſt, from N. to S. It lies to the E. of *Cuba* and *Jamaica*, and to the W. of *Porto Rico*, from which it is ſeparated by a narrow channel.

The climate is extremly hot, although refreſhed by the ſea breezes, yet the air is not reckoned unwholeſome; for ſome of the inhabitants are ſaid to live to above a hundred years of age. Its ſalubrity is ſaid to be owing in a great meaſure to its beautiful variety of hills and vallies, woods and rivers.

This iſland is conſidered as the moſt fruitful and moſt pleaſant of any in the *Weſt Indies*; its foreſts contain *cabbage-trees*, *palms*, *elms*, *oaks*, *pines*, and other trees; with more beautiful and better taſted fruit than any in moſt of the other iſlands, particularly *pine-apples*, *bananas*, *oranges*, *lemons*, *citrons*, *limes*, *grapes*, *dates*, and *apricots*. Here are alſo all the birds common to the *Weſt Indies*. In the ſavannas, or meadows, are innumerable herds of black cattle, that run wild in the country; horſes enough in the *French* part of it to ſupply all the neighbouring colonies, beſide wild horſes and wild hogs of the breed brought over by the *Spaniards*. There is ſcarce a country in the world better watered, either by brooks or navigable rivers, which are all full of fiſh, and the coaſt abounds with turtle. In the ſands of theſe rivers gold-duſt is found, and it had, when firſt diſcovered, mines of *gold*, *ſilver*, and *copper*.

The chief commodities of the iſland are hides, ſugar, indigo, cotton, cacao, coffee, ginger, tobacco, ſalt, wax, honey, ambergriſe, and various kinds of drugs and wood for dying; but it produces little corn. The *French* here are ſaid to equal, if not to out-number, the *Spaniards*, and both together fall very ſhort of what the extent and fertility of the iſland is capable of ſupporting.

We have already mentioned the *Spaniards* attempting to ruin *St. Chriſtopher*'s, when divided between the *Engliſh* and *French*; but by this unjuſt act they brought upon themſelves a very ſevere revenge: for ſeveral of the *French* inhabitants, who were expelled from *St. Chriſtopher*'s, being reduced to great indigence, began to think of deſperate courſes. They betook themſelves to piracy, and uniting with ſome *Engliſh*, *Dutch*, and other reſolute fellows, they reſolved to begin a piratical war with the *Spaniards*. At firſt they ſatisfied themſelves with taking their ſhips, and deſtroying their trade. This they did effectually; but ſoon encouraged, and ſtrengthened by this ſucceſs, they landed upon the continent of *New Spain* and *Terra Firma*, burning and plundering the open country. Their number and boldneſs increaſing with their ſucceſs, they aſſembled and took ſome of their ſtrongeſt fortreſſes and opulent cities, particularly *Porto Bello*, *Campeachy*, and *Maracaibo*; they even took the city of *Panama* by ſtorm, and burnt it, after defeating an army which came to its relief. In all theſe places, and in the others they had taken, they gained an incredible booty, and committed the moſt unheard of cruelties. Another party of theſe pirates paſſing the ſtraits of *Magellan*, and entering the *South Sea*, rendered the whole coaſt of *Peru*, *Chili*, and *Mexico*, one ſcene of deſolation, while they were every where attended with ſucceſs, becauſe they every where acted with the bravery and conduct that, in a more juſt cauſe, would have merited the higheſt honours.

Theſe pirates, whom we improperly called *Buccaneers*, the *French* denominated *Flibuſtiers*, from the *Dutch* fly-boats, in which they made their firſt expeditions. The *Buccaneers* are perſons who hunt wild cattle in *America* for their hides and tallow: ſome of whom joined the *Flibuſtiers* in their firſt expeditions, and from them the *Engliſh* gave the name of *Buccaneers* to the whole body. Theſe people frequently brought their prizes and plunder to *Jamaica*, as already obſerved, by which they greatly enriched that iſland. Others finding that the *Spaniards* were ſo weak in *Hiſpaniola* that they had in a manner deſerted a conſiderable part of the iſland, made it a place of rendezvous. They who hunted the wild cattle, found the deſerts, which the *Spaniſh* tyranny had produced, abounding with animals. To theſe two deſcriptions of people were added a third, who were *French*, of the *Leſſer Antilles*; who, finding how much might be gained by ſupplying men who were laviſh in their expences, and not very exact in their bargains, and perceiving that no part of *America* afforded a better ſoil, paſſed over to this iſland, and exerciſed the employment of planters and merchants. Theſe three ſorts of people, who were mutually of uſe to each other, lived upon very good terms; and although they were frequently diſlodged by the *Spaniards*; yet they ſtill returned with freſh ſtrength; ſo that it was with difficulty that the *Spaniards* were able to retain one part of the iſland.

The *French* court connived at the progreſs of theſe people, although whenever complaints were made, it diſavowed their proceedings: but when at length the *French* in *Hiſpaniola* became numerous, powerful and wealthy, it owned them as ſubjects, ſent them a governor, and regular forces to defend them in what they had done: the former practice of piracy was ſtill connived at, while the trade of ſkins increaſed, and the plantations were extended. At length the *French* obtained a legal right by the ceſſion which the *Spaniards* made them of the N. W. part of the iſland, the beſt and moſt fertile part, by the treaty of *Ryſwic*, in 1697; and this is one of the principal ſettlements of the *French* in the *Weſt Indies*.

It begins at a large plain called *Bahaia*, on the N. ſide of the iſland, about thirty miles E. of *Cape François*, extending all along the coaſt; from thence to the W. reaching on the S. ſide as far as *Cape Morgan*; it being two hundred leagues in circuit, and, including the windings, about a hundred more.

This colony, if a ſettlement derived from ſuch an origin deſerves the name, has ſince met with great encouragement from *France*, and in 1726 it had no leſs than thirty thouſand whites, and a hundred thouſand negroes; they made ſixty thouſand hogſheads of *ſugar* of five hundred weight each; the *indigo* was half as much in value as the ſugar; they likewiſe exported large quantities of *cotton*, and alſo ſent a conſiderable quantity of *cacao* and *ginger* to *France*. Since that time they have raiſed *coffee* here to a very great amount, and all the other branches of their commercial products have, ſince that period, increaſed to an aſtoniſhing degree. A *Spaniſh* writer of great judgment, who was well informed, reckons the produce of the plantations near *Cape François*, the capital of *French Hiſpaniola*, and which were ſhipped from that ſingle town, at thirty thouſand tons in *ſugar*, *tobacco*, *indigo*, and *coffee*, which, at the loweſt calculation, cannot amount to leſs than ſix hundred thouſand pounds ſterling. If to this be added the exports of the two conſiderable ports of *Petit Guaves* and *Leogane*, and the other inferior ones, which are ſuppoſed to ſend out all together at leaſt as much as the capital, the exported produce of the iſland muſt be annually worth one million two hundred thouſand pounds. There is another branch of trade of extraordinary advantage to the mother-country, which is carried on with the *Spaniards* wholly in the manufactures of *France*, and for which they receive their returns in ſilver; and this article alone is ſaid to bring annually to *France* no leſs than two millions of dollars.

The principal places in the iſland are CAPE FRANCOIS, which is ſituated on the northern part, and is by the *French* often called the *Cape*, by way of eminence. It lies in 19°. 46′. N. latitude, and in 72°. 18′. W. longitude, and contains about eight thouſand whites and blacks. In the middle of it is a ſpacious ſquare, about three hundred paces in length and breadth, at which ſeven or eight ſtreets terminate: but this town was deſtroyed in the begining of the reign of king *William* by the *Engliſh* and *Spaniards* in conjunction. The town is now neither walled nor paled in, and is ſaid to have only two batteries, one at the entrance of the harbour, and the other before the town.

LEOGANE, on the W. ſide, though inferior in point of ſize, is a good port, a place of conſiderable trade, and the ſeat of the *French* government, which is in the hands of the governor and an intendant, who are mutually a check upon each other. There are beſide two other towns conſiderable for their trade, *Petit Guaves* at the W. end of the iſland, and *Port Louis* on the S. W. part.

The capital city belonging to the *Spaniards* is ST. DOMINGO, ſituated in 18°. 17′. N. latitude, and 69°. 27′. W. longitude. It is a large well built city, with a good port, and has ſeveral magnificent ſtructures, particularly the houſes of the king of *Spain*'s collectors; with a fine cathedral, ſeven large monaſteries, and two nunneries; beſides a mint, and a college, which has a revenue of four hundred ducats; an univerſity, and an hoſpital endowed with twenty thouſand ducats a year. This city is the ſeat of an archbiſhop, and the reſidence of the governor-general of the *Spaniſh Indies* and of the judges of the royal courts. The principal part of the little trade the *Spaniards* have in this iſland is carried on from this port, which has fifteen fathoms water at the bar, is large and ſecure, being defended by ſeveral batteries and a caſtle, with other fortifications. The town is built of ſtone after the *Spaniſh* manner, and has a large ſquare market-place in the centre, about which are the cathedral and other public buildings; and from this ſquare the principal ſtreets run in a direct line, they being croſſed by others at right angles. The town is almoſt of a quadrangular form, and its ſituation very delightful, between a large navigable river on the W. the ocean on the S. and a fine fruitful country on the N. and E.

In the part of *Hiſpaniola* poſſeſſed by the *French*, are the two following iſlands:

ST. LOUIS, about ſix leagues to the N. E. of the *Iſle of Vache*, and is ſcarce half a mile long, and not a quarter of a mile over; but the *French* have here a fort. This iſland is overflown at high water. It is ſeparated from *Hiſpaniola* by a ſtrait not three quarters of a mile in breadth, where ſmall veſſels ride in deep water cloſe to the ſhore. There is not a drop of freſh water to be procured upon it, and the rain ſoaks through it immediately as if it were a ſieve; ſo that thoſe who live upon it fetch their water every day from a little river in *Hiſpaniola*, at the diſtance of a mile and a half. In 1737, an hurricane in this little iſland levelled a town with the ground, except the church and two houſes: ſeveral dwellings about the fort were alſo blown down; the ſhips that were at anchor under it were caſt upon the coaſt, or driven out to ſea; but ſome veſſels and magazines were burnt by lightning, ſeveral perſons were drowned, and all the ſugar-canes and cotton-trees were deſtroyed.

VACHE, or COWS-ISLAND, is about three leagues from *Hiſpaniola*, and five or ſix miles in length. The ſoil is very good, and it has two or three tolerable ports, one of which is able to receive ſhips of three hundred tons burden. The iſland is conveniently ſeated for a trade with the *Spaniſh* colonies on the continent of *America*, and for maintaining an intercourſe with the iſland of *Cayenne*, the only *French* ſettlement on the coaſt of *South America*. It received its name from being uſed for the grazing of black cattle and hogs, and here the *Buccaneers* uſed formerly to rendezvous to ſhare the ſpoils they took from the *Spaniards*.

There are many other ſmall iſlands round *Hiſpaniola*, particularly on the weſtern and northern coaſts, moſt of which are uninhabited.

ST. BARTHOLOMEW.

THIS iſland is ſituated in 17°. 40′. N. latitude, and in 62°. 43. W. longitude, twenty-five miles N. of *St. Chriſtopher's*; it is reckoned only fifteen miles in circumference, but produces *tobacco* and *caſſava*, and is covered with trees that give it a delightful appearance, as the *ſope-tree*, the *calabaſh-tree*, the *canapia-tree*, which yields a very pleaſant and ſalutary gum, *lignum-vitæ*, and *iron-wood*. On the ſhore are found the fiſh called the *ſea-ſtar* and the *ſea-apple*. It has not a ſingle ſpring of freſh water, ſo that the rain water is carefully collected in ciſterns. It is encompaſſed by ſo many rocks, that it is dangerous for ſhips of burden to approach it. The harbour is, however, a very good one, and from thence in time of war the *French* greatly annoy our trade. Its chief productions for exportation are *drugs* and *lignum-vitæ*, with *lime-ſtone*, which the inhabitants ſend to the neighbouring iſlands.

MARIAGALANTE

IS ſeated in 15° 52′ N. latitude, and 61° 11′ W. longitude from *Greenwich*, about thirty miles N. of *Dominica*, and forty E. of *Guadaloupe*; it was diſcovered by *Columbus* in 1493, who gave it the name of his own ſhip.

This iſland, which is about ſixteen miles from N. to S. and four from E. to W. is full of hills; along the eaſtern ſhore run high rocks, ſo perpendicular, that they ſeem to be formed by art, and give ſhelter to a prodigious number of tropic birds, they being as full of holes as a pigeon-houſe. On the S. E. ſide of the iſland are black rocks; but the weſtern ſhore is plain. The iſland has ſeveral large grottoes, with many little ſtreams, and ponds of freſh-water: it is covered with trees; and particularly abounds with *tobacco*, and the wild *cinnamon-tree*.

DESEADA, or DESIRADA,

THAT is, *The Deſirable Iſland*, received its name from *Columbus*, it being the firſt of the *Caribbee Iſlands* he diſcovered in his ſecond voyage 1493. It is ſituated in 16° 20′ N. latitude, and in 61° 20′ W. longitude; about twenty miles to the N. E. of *Guadaloupe*. It extends ſixteen miles in length, and two in breadth. Some part of it is very fertile, the ſoil being proper for the cultivation of ſugar and cotton, of which laſt it produces the beſt in all the *French* iſlands, the new acquired iſland of *Tobago* excepted.

GUADALOUPE.

THE iſland of GUARDALOUPE, or GUADALOUPE, was thus called by *Columbus*, from the reſemblance which its mountains bore to thoſe of that name in *Spain*. It is ſituated in 15° 59′ N. latitude, and in longitude 61° 59′ W. from *Greenwich*, about thirty leagues to the N. W. of *Martinico*, and is the largeſt, as well as the fineſt of the *French Leeward Iſlands*, being about forty-five miles in length, and thirty-eight in breadth; and is divided into two parts by a ſmall arm of the ſea, or rather a narrow channel, through which no ſhip can venture; but the inhabitants paſs it in a ferry-boat. The country on the E. ſide, which is called *Grand Terre*, is deſtitute of freſh water, which abounds in the other diviſion; it is defended by *Fort Louis*, and a redoubt which commands the road. The weſtern part is called *Baſſe Terre*, and here the principal town ſtands, which is defended by a citadel and other fortifications.

In this iſland is a hill, called *La Soufriere*, or the *Mountain of Sulphur*, which riſes to a great height; the top of it is bare, nothing growing upon it but fern, and ſome ſorry ſhrubs laden with moſs; but it affords a fine view of *Dominica*, *Mariagalante*, *Martinico*, *Montſerrat*, *Nevis*, and the other neighbouring iſlands. Upon the higheſt part is a rugged platform covered with burnt ſtones of all ſizes, and from ſeveral clifts and chinks iſſue ſmoke. On the E. ſide are two mouths which open into a pit of ſulphur, one of which is an oval hole of about an hundred feet in its greateſt diameter, out of which alſo frequently ariſe thick clouds of black ſmoke, accompanied with ſparks of fire. The negroes who ſell brimſtone fetch it from this mountain. About two hundred paces below the loweſt of theſe mouths are three pools of very hot water, four or five paces from one another: the water of the largeſt is very dark coloured, and ſmells like that in a ſmith's forge: the ſecond is whitiſh, and has the taſte of allum: the third is blue, and has a vitriolic taſte. Here are alſo ſeveral ſmall ſprings, which, uniting their ſtreams, form ſeveral torrents. The middle and bottom of this burning mountain are extremely different from the top of it, being covered with tall trees and herbage, watered by a number of rivulets, and cultivated with the utmoſt care and induſtry.

The air is clear and ſalubrious, and among the vegetables are the *copau-tree*, famous for its ſanative balſam or oil: the *milk-ſhrub*, from whoſe fibres are preſt a liquor that reſembles milk; and the *corbary-tree*, which bears fruit covered with a ſhell, within which is a downy pulp of a ſaffron colour, that yields a gum, which being hardened in the ſun, becomes very clear and ſolid, ſo that the native *Caribbeans* formerly uſed it for bracelets and other ornaments.

The moſt remarkable bird is one ſaid to be peculiar to this iſland and *Dominica*, though it is a bird of paſſage. It is called the *devil-bird*, from the blackneſs of its plumage, and is of the ſize of a young pullet. Its wings are long, its legs ſhort, and its feet, which are like thoſe of a duck, have ſtrong claws: its beak is crooked, ſharp, hard, and in length about an inch and a half: its eyes are large, and ſerve to diſtinguiſh fiſh, which it catches at night in the ſea; but it is unable to bear the light of day when flying; ſo that theſe birds often ruſh upon interpoſing objects and fall down. After having fiſhed in the night, they repair to the *Devil's Mountain*, where they lodge by pairs in holes like rabbits. They continue there during the months of October and November, though they are ſeen ſingly in other months; but all of them diſappear in May, and are never ſeen again till September. The negroes of the iſland have a peculiar way of hunting theſe birds with dogs and hawks. Their fleſh, when cured of its fiſhy taſte, is good and nouriſhing food; and, during their ſeaſon, the negroes and people of the iſland ſubſiſt upon them.

The gulfs on the coaſt of *Guadaloupe* contain *turtles*, *ſharks*, *land crabs*, and many kinds of fiſh.

The bees of *Guadaloupe* are entirely different from thoſe of *Europe*, being black, ſmaller, and without ſtings. They never hive but in hollow trees, and their wax, which is of a dark purple, approaching to black, is too ſoft for candles, and cannot be bleached. Theſe bees, inſtead of making combs, depoſit their honey in bladders of wax, about the form and ſize of a pigeon's egg: but this honey is ſaid never to harden, nor become of any other conſiſtence than that of olive oil.

This iſland is infeſted with an inſect called a *ravet*, ſhaped like a May-bug, of an offenſive ſmell, and preying upon paper, books, or furniture; and whatever they do not gnaw, is diſcoloured by their ordure. Theſe offenſive inſects, which are very numerous, and appear chiefly by night, would be intolerable, were it not for a large ſpider which entangles them in its web, and takes all opportunities of ſurpriſing them; on which account the inhabitants are very careful not to offer the leaſt injury to theſe ſpiders.

Under the government of *Guadaloupe* are comprehended *Deſeada*, juſt deſcribed, and the iſlands of *Xaintes*, or *All Saints*. Theſe are three in number, and their ſoil is pretty much the ſame with that of *Gaudaloupe*. The weſternmoſt iſland, which is the beſt, is about nine miles in compaſs; but none of them ſeem ever to have been ſtatedly inhabited, on account of their being deſtitute of freſh water, though they produce all the other neceſſaries of life.

We have no account of the hiſtory of this iſland, from the time of *Columbus* to the inſtitution of the *French* general company of the *American Iſlands* in 1635, who being unable of themſelves to plant or cultivate their iſlands, empowered M. *St. Olive*, their lieutenant-general of *St. Chriſtopher's*, and M. *du Pleſſis*, to contract with ſome merchants of *Dieppe* for ſettling *Guadaloupe*. The religious differences in *France* ſoon produced adventurers, who, beſides the inducement of enjoying liberty of conſcience, were ſtimulated by views of intereſt. Thoſe merchants contracted with four hundred men, who were obliged to ſerve them four years; but many of the Proteſtant adventurers were far from imagining that the new ſettlement was under the direction of cardinal *Richlieu*, who ſent with them four *Dominican* friars, provided with full powers from pope *Urban* VIII.

This firſt ſettlement proved very unſucceſsful. The natives; who had received the *French* with great kindneſs, ſupplied them with the productions of the iſland, and inſtructed them in the beſt methods of catching turtle and other fiſh, receiving in return for theſe eſſential ſervices only inſults and oppreſſions, withdrew their aſſiſtance and relief from a people ſo unworthy, and the *French* ſettlers ſoon felt all the miſeries of famine. *Du Pleſſis* died in a ſhort time, and *St. Olive*, who then became governor, increaſed the miſeries of this wretched colony by his extreme miſconduct.

The ſettlement after this ſuffered greatly by other bad governors, by hurricanes, and by ſwarms of caterpillars.

It was afterward under the new *Weſt India* company; but in 1674, was taken into the king's hands, whoſe miniſters adopted a commercial ſyſtem, and it ſoon became the moſt flouriſhing colony ſubject to *France*, next to *Martinico*; where all its produce was firſt ſent, and from thence ſhipped for *Europe*.

The preference given by the *French* miniſtry to *Martinico*, by making it the centre of all their *Weſt Indian* commerce, greatly retarded the progreſs of *Guadaloupe*; ſo that in the year 1700, the number of its inhabitants amounted, according to the *Abbé Raynal*, to no more than 3825 white people, 325 ſavages, free negroes and mulattoes, beſides 6725 ſlaves, many of whom were *Caribs*. At the end of the year 1755, the ſame writer informs us, the colony was increaſed to 9643 whites, 41,140 ſlaves, and her produce had advanced in a yet greater proportion than her population. *Guadaloupe* was fortified with forts and redoubts, which were in ſo good a condition in 1702, when admiral *Benbow* made a deſcent upon the iſland, with a conſiderable body of land-forces, that he did not think proper to attack them, but he deſtroyed many of their plantations and open villages. This iſland was taken by the *Engliſh* in the year 1759. During the four years of their poſſeſſion it improved to an aſtoniſhing degree in fruitfulneſs and importance; but theſe benefits were tranſmitted to the former poſſeſſors by its being reſtored at the peace of 1763.

Since this repoſſeſſion, the *French* have permitted the planters to tranſmit the produce of their lands directly to *France*, inſtead of the former mode of ſending it to *Martinico*. An ordinance has alſo been publiſhed, by which no foreign veſſel is allowed to navigate nearer its coaſts than the diſtance of a league, or ſend any boat aſhore, without a written permiſſion from the intendant, on the penalty of the confiſcation of the veſſel and cargo, the captain paying three hundred livres, (13*l.* 2*s.* 6*d.*) and ſuffering a year's impriſonment.

Martinico,

THE moſt northern of the *Windward Iſlands*, is not only the chief, but the largeſt of the *French Caribbee Iſlands*, and is ſituated between 14° 18′ and 14° 59′ N. latitude, and between 60° 31′ and 61° 21′ W. longitude, about ſeventeen leagues N. W. of *Barbadoes*. It is near ſixty miles in length from the N. W. to the S. E. but is of a very unequal breadth, and about one hundred and thirty miles in compaſs.

The air is hotter here than at *Guadaloupe*, but hurricanes have neither been ſo frequent nor ſo violent as in that and ſome other of the *Caribbee Iſlands*. Though *Martinico* is generally ſaid to be healthful to the people ſettled upon it, yet it is certain, that the great quantity of water that runs through it, creates an humidity very noxious to the inhabitants in general.

The country is hilly within the land, and at a diſtance reſembles three diſtinct mountains. Alſo on the N. ſide are three rocks, ſo ſituated, that when viewed from the ſea, they give it the appearance of three ſeparate iſlands.

It is ſaid to have no leſs than forty rivers, ſome of which are navigable a great way up the country. However beſide the ſtreams, which in the rainy ſeaſon overflow the dales and ſavannahs, there are ten rivers that are never dry, which run from the mountains into the ſea, and ſometimes overflowing their banks, carry away trees and houſes. Some of the hills are cultivated, and on their ſteep aſcents *tobacco* grows, which is of a better quality than that in the valleys: other hills are overgrown with trees, that afford ſhelter to wild beaſts and to abundance of ſnakes. The other produce of the iſland is much the ſame with that of *Barbadoes*, namely, *ſugar*, *cotton*, *indigo*, *ginger*, *aloes*, *pimento*, *Indian figs*, *bananas*, *pine-apples*, *melons*, *caſſia*, *mendiaca*, *potatoes*, and other roots. The coaſt abounds with commodious bays and harbours, in which are plenty of trees.

Martinico is not only eſteemed the chief of the *French Caribbee Iſlands*, but is the reſidence of the governor-general and an intendant. It is likewiſe the ſeat of a ſovereign council, which ſuperintends all their other iſlands, and even their ſettlements in *St. Domingo*. This council conſiſts of the governor-general, the intendant, the governor of the iſland, an attorney-general, the lieutenant-governor for the crown, and twelve counſellors. Their power is very extenſive, for this council judges in the laſt reſort upon all matters brought by way of appeal. The governor-general, if upon the iſland, is preſident of the council, or, during his abſence, the intendant. If both are abſent, the eldeſt counſellor then preſent collects the votes, and pronounces the ſentence of the court. The other officers of the iſland are two lieutenant-governors, one for *Cape Terre*, and the other for *Baſſe Terre*, with a ſecretary of the marine, who has a very extenſive commiſſion.

The principal places in *Martinico* are *St. Peter*'s and *Port Royal*.

ST. PIERRE, OR ST. PETER'S, the capital of *Martinico*, was built in 1665, in order to overawe the mutineers of the iſland, who rebelled againſt its proprietors, the ſecond *Weſt India* company, who were at the ſame time the proprietors of all the *French Antilles*. It is ſituated on the weſtern ſide of the iſland. The town extends along the ſhore, and a battery, that commands the road, is erected on the W. ſide, which is waſhed by the river *Royolan*, or *St. Peter*. The town is divided into three wards; the middle, which is properly *St. Peter*'s, begins at the fort, and runs weſtward to the battery of *St. Nicholas*. Under the walls of the ſecond ward ſhips at anchor ride more ſecurely than under the fort, on which account this ward is called the *Anchorage*. The third ward, called the *Gallery*, extends along the ſea-ſide from *Fort St. Peter* to the *Jeſuits' River*, and is the moſt populous part of the city. The houſes of *St. Peter*'s ward are neat, commodious, and elegant, particularly thoſe of the governor of the iſland, the intendant, and the other officers. The pariſh-church of *St. Peter* is a magnificent ſtone building which belonged to the *Jeſuits*, with a noble front of the *Doric* order. The church of the *Anchorage*, which belongs to the *Jacobine* friars, is likewiſe of ſtone.

FORT ROYAL, the next place of conſequence in *Martinico*, is twenty-one miles diſtance by land, and twenty-ſeven by water from *Fort St. Peter*, in a S. E. direction; but the road is ſo very incommodious, that travellers generally chooſe to go by water. This fort is built on an eminence fifteen fathoms above the ſurface of the ſea, by which it is almoſt ſurrounded, there being only a neck of land about fifteen fathoms over; ſo that it may be ſaid to be built on an iſthmus. Though the town contains regular ſtreets, and a large church belonging to the *Capuchins*, it is ſaid to be much inferior to *St. Peter*'s. Its latitude is 14° 36′ N. and its longitude is 61° 9′ W. from *Greenwich*.

CUL DE SAC ROBERT is ſeated in a large bay almoſt two leagues deep, with two ſmall iſlands at its entrance, which, by breaking the force of the waves, render it a fine, ſafe, natural harbour, on the N. E. ſide of the iſland.

FORT TRINITY lies at the bottom of *Trinity-bay*, and is formed by *Point de Caravel* on the W. ſide, and on the E. by an iſthmus about two hundred feet broad. The lieutenant-governor of *Cape Terre* has his reſidence in *Trinity Town*, in which a conſiderable number of merchants reſide; and its convenient ſituation for the *European* trade, and the ſafety of its port, have cauſed it to become one of the moſt thriving places in the iſland; it having very conſiderable manufactures of *cotton*, *ſugar*, *cacao*, and other commodities.

This iſland was firſt ſettled by the *French* from *St. Chriſtopher's*, in the year 1637; who for many years maintained a continued warfare with the natives; but having acquired a knowledge of the art of cultivating the ſugar cane, they increaſed in numbers and ſtrength. Some time after it was put under the ſuperintendence of a *Weſt India* company, which had been formed in *France*; in conſequence of which, duties were impoſed, which created much diſcontent, and produced at one time an open revolt.

In the year 1650, the old *Weſt India* company ſold *Martinico*, *St. Lucia*, *Grenada*, and the *Grenadines*, to *Parquet*, for fifty thouſand livres, (2187*l.* 10*s.*) In 1664, *Lewis* XIV. obtained the poſſeſſion of this iſland, and granted it to a new *Weſt India* company: ten years after he ſuppreſſed that company, and all the above iſlands became part of his domain. After this, *Martinico* was attacked by *De Ruyter*, the *Dutch* admiral; and the *Engliſh* made many unſucceſsful attempts againſt it.

In 1700, *Martinico* was computed to contain 6,597 white men. The ſavages, mulattoes, and free negroes, men, women, and children, amounted to no more than 507; the number of ſlaves was but 14,566: all theſe together made a population of 21,640 perſons. The iſland produced a great quantity of *cacao*, *tobacco*, and *cotton*; had nine *indico-houſes*, and 183 ſmall *ſugar-plantations*.

In 1727, a dreadful earthquake happened, which, with ſhort intervals, laſted eleven hours, and overthrew *St. Peter*'s fort. Many people loſt their lives, and beſides churches, convents, and other public buildings, above two hundred ſugar-works were ruined. One mountain was levelled, another cleft aſunder, and copious ſtreams of water iſſued from the chaſm. However, a few years recovered the iſland, the inhabitants having the *Guadaloupe* ſugars ſhipped from hence, with many other advantages.

Immediately, upon the peace of *Utrecht*, *Martinico* emerged from that feeble ſtate, which her inteſtine commotions, and the falſe policy of *France* had kept her, and ſoon roſe to a great degree of proſperity. She became the mart for all the *French* windward ſettlements. It was in her ports that the neighbouring iſlands ſold their produce, and bought the commodities of the mother country. The *French* navigators loaded and unloaded their ſhips no where elſe. *Martinico* was famous all over *Europe*; ſhe was at once a planter and an agent, whilſt ſhe was a trader with *Spaniſh* and *North America*. So many proſperous engagements brought immenſe ſums into *Martinico*. "This is, perhaps, the only country in the world," ſays the *Abbé Raynal*, "where ſpecie has been ſo conſiderable, as to make it a matter of indifference to them, whether they dealt in gold, in ſilver, or in commodities. Her extenſive trade annually brought into her ports two hundred ſhips from *France*; ſixty from *Canada*; ten or twelve from the iſlands of *Margaretta* and *Trinidad*; beſides the *Engliſh* and *Dutch* ſhips that came to carry on a ſmuggling trade." The private navigation from the iſland to the northern colonies, to the *Spaniſh* continent, and to the more windward iſlands, employed one hundred and thirty veſſels from twenty to ſeventy tons burden, manned with ſix hundred *European* ſailors of all nations, and one thouſand five hundred ſlaves, long inured to ſea-ſervice. The war between *Great-Britain* and *France*, which broke out in the year 1744, was very deſtructive to the intereſt of *Martinico*; and when the peace of *Aix la Chapelle*, at length reſtored the freedom of trade, and with it the hope of recovering the proſperity of the iſland, the event did not anſwer the expectation. The colony loſt the contraband trade with the *American Spaniards*; the adminiſtration of *France* laid ſuch reſtrictions on the trade to *Canada*, as amounted almoſt to a total prohibition, and in a ſhort time a freſh war gave riſe to a new train of calamities.

The *Engliſh* in vain attempted to take *Martinico* in the year 1759, but in 1761, a reſolution was formed, of ſending an armament againſt that iſland, ſuperior to any that had ever been ſeen in thoſe ſeas. The command of the land forces was given to General *Monckton*, and of the fleet to rear admiral *Rodney*. This force arrived at *St. Ann's bay*, near *Fort Royal*, on the 7th of *July*, 1762, and on the 3d of *February* the iſland ſurrendered upon honourable and advantageous terms.

The people of *Martinico* remained with great tranquillity under the military government of the *Engliſh* during the ſhort time they held it, and even ſeemed well pleaſed at their change of maſters. It was reſtored to the *French* by the definitive treaty of 1763. Since which time very great additions have been made to the ſtrength of the place, on which upward of 300,000*l.* ſterling has been expended.

The *Abbé Raynal* informs us, that in 1769, *France* imported from *Martinico*, in two hundred and two trading veſſels, 177,116 quintals of fine ſugar, and 12,579 quintals of raw ſugar; 68,518 quintals of coffee; 11,731 quintals of cacao; 6,045 quintals of cotton; 2,518 quintals of caſſica; 783 caſks of rum; 307 hogſheads of molaſſes; 150 pounds of indigo; 2147 pounds of preſerved fruits; 47 pounds of chocolate; 282 pounds of raſped tobacco; 494 pounds of rope yarn; 234 cheſts of liquieurs; 451 quintals of wood for dying; and 12,108 hides in the hair. He ſtates the firſt coſt of theſe commodities in the iſland to be 536,621*l.* ſterling. The exports from the mother country to *Martinico*, during the ſame year, in various articles of merchandize, he ſtates at 588,412*l.* ſterling, part of which was ſent to the *Spaniſh* coaſts, and part to the *Engliſh* ſettlements.

The iſland, in the year 1763, began to be infeſted with vaſt ſwarms of ants, a ſpecies of inſects formerly unknown in the *Weſt Indies*. In many parts of the iſland, all the uſeful vegetables were deſtroyed by them; they even infeſted the largeſt trees in ſuch a manner, that birds of the coarſeſt kind would not light upon them. The inhabitants, particularly the children, were almoſt devoured by theſe vermin. This plague of ants ſubſided, as it had ariſen, without any apparent cauſe being aſſignable; but the lands, which had been over-run by theſe invaders, could not be brought to yield the ſugar-cane.

St. Lucia, *or* St. Lucie.

THIS iſland received its name from being diſcovered on the day dedicated to the a legendary virgin martyr named *St. Lucia*. It is ſituated in 13°. 24'. N. latitude, and in 60°. 51'. W. longitude, lying about ſix leagues S. of *Martinico*, and N. from *St. Vincent*, and is twenty-one leagues to the W. N. W. of *Barbadoes*, which, it is ſaid, may be ſeen from thence in a clear day. *St. Lucia* is twenty-three miles in length, and twelve where broadeſt; it is long and narrow, its whole circumference is forty-five leagues. Its ſoil is dry and ſtony, and has been generally conſidered as an unwholeſome and unkindly ſpot by the *Weſt Indian* planters. It has ſome high and craggy mountains, which bear evident marks of volcanos; in one deep valley there are ſeveral ponds, the water of which boils up in a very powerful manner. The ſtreams that iſſue from it retain their heat at the diſtance of three miles from their ſource.

The *Careenage* harbour lays to leeward; it has good ſoundings, with an excellent bottom. Here are three careening places for ſhips, and thirty ſhips of the line may ride here in ſafety. The wind is always favourable for ſailing out.

On one ſide of this harbour is an eminence called *Morné Fortuná*, the ſummit of which is broad and level, which points it out as a ſpot uncommonly favourable for erecting a fortification. The *French*, to whom this iſland was ceded by the peace of *Paris*, in 1763, had it in contemplation to build a citadel here, as well as to erect a town on the back of this mountain. There are nine pariſhes on this colony, eight to leeward, and one to windward; the reaſon of preferring the leeward ſide of the iſland, was on account of the convenience of ſhipping. A road has been made all round the iſland, and two others croſs it in the direction of E. and W. Whilſt theſe public works were carrying on, the cultivation of the iſland was greatly retarded, but the advantages derived from an eaſy communication with the ſeveral parts of the ſettlements, will ſoon be found extremely beneficial.

The *Engliſh* firſt ſettled on the iſland of *St. Lucia*, in the year 1639, but were driven out by the *Caribbs* the year following. No ſettlement was afterward made, until 1650, when *M. de Parquet*, governor of *Martinico*, took poſſeſſion of the iſland for the *French* king. Whilſt he lived a friendly intercourſe was maintained with the *Carribbs*, but he dying, his ſucceſſor, *M. la Riviere*, was barbarouſly cut off by the natives, with many of the ſettlers.

In the year 1663 the *Engliſh* purchaſed the iſland from the natives, and made a ſettlement conſiſting of fourteen or fifteen hundred perſons; but a great mortality prevailing, the colony was brought very low, and thoſe who ſurvived abandoned the iſland three years afterward.

Although the *Engliſh* conſidered the right in the iſland as theirs, yet the *French* again took poſſeſſion of it in the year 1719, but on proper repreſentation being made it was evacuated. The Duke of *Montague* ſoon after obtained a grant of this iſland, and that of *St. Vincent*, from *George* I. and ſettled a colony, which was not proſperous, and it was agreed between the *Britiſh* and *French* governments, that the iſland ſhould be abandoned, and, together with ſeveral others, be conſidered as neutral.

By the ninth article of the peace of *Paris*, in the year 1763, it was ſtipulated that the neutral iſlands ſhould paſs into the poſſeſſion of one or other of the two crowns, and *St. Lucia* was aſſigned to *France*.

In January 1772, the number of white people on this iſland appeared to be two thouſand and eighteen ſouls, men, women, and children; that of the black ſix hundred and ſixty-three freemen, and twelve thouſand ſeven hundred and ninety-five ſlaves. Its exports then amounted, according to the *Abbé Raynal*, to 175,000 *l.* ſterling. The ſame writer ſuppoſes its trade likely for ſome time to increaſe, at the rate of one eighth every year; that fifty thouſand ſlaves may be employed here, and that the higheſt extent of trade, which it is capable of reaching, is 437,000 *l.* ſterling yearly.

In the year 1779, the iſland was reduced by the *Engliſh*; ſoon after an attempt was made, by the count *D'Eſtaing*, to recover it, but ſuch was the firmneſs with which the attack was received, that the aſſailants were compelled to retreat to their ſhips. By the ſeventh article of the peace of *Verſailles*, *St. Lucia* was reſtored to *France*.

TABAGO, *or* TOBAGO,

THE moſt ſouthward of all the *Caribbee Iſlands*, and the moſt eaſtward of any, except *Barbadoes*, is ſeated in 11° 10′ N. latitude; and in 59° W. longitude, about forty leagues to the E. of *St. Vincent*, thirty leagues E. of *Grenada*, ten leagues N. E. of *Trinidad*, and thirty-ſeven S. of *Barbadoes*. It is thirty-two miles in length from the S. W. to the N. E. and about nine broad, the whole being above ſeventy miles in compaſs. At a ſmall diſtance from the N. E. extremity, is a ſmall iſland called *Little Tobago*, which is two miles in length, and a mile in breadth.

The climate of *Tobago* is not ſo hot as might be expected from its ſituation ſo near the equator; nor is this iſland viſited by ſuch dreadful hurricanes as frequently deſolate the other *Weſt India* iſlands.

The ſurface of the iſland is agreeably diverſified with hills and vales; its N. W. extremity is mountainous; but no part of it is rugged and impaſſable. Its ſoil is of different kinds; but in general its mould is black, rich, and proper for producing, in the greateſt plenty, whatever is raiſed in other parts of the *Weſt Indies*. The many ſprings on the iſland contribute to its healthfulneſs, and its bays and creeks are ſo diſpoſed as to be very commodious for all kinds of ſhipping: yet its ſituation requires fortifications, eſpecially as the natural richneſs of the iſland ſerves to invite invaders.

The valuable trees which grow in *Tobago* are perhaps its richeſt produce; for, beſides its producing the different kinds of wood to be found in the *Weſt India* iſlands, the *Dutch*, by whom it was once ſettled, affirm, that both the true nutmeg and the cinnamon-tree, with that which produces the real gum-copal, grow upon this iſland. This iſland is alſo ſaid to produce five different kinds of pepper, the long, the cod, the bell, the round, and *Jamaica* pepper, all which are ſaid to grow upon the iſland without culture.

The ſoil naturally produces *Indian* and *Guinea* corn; but no *Engliſh* grain, except *peaſe* and *beans*, can be riſed there. The *fig-trees* produce as good fruit as thoſe of *Spain* and *Portugal*. The *pomegranate*, the *pine-apple*, the *banana*, the *prickle-apple*, *oranges* of two ſorts; *lemons* and *limes* of both kinds, ſour and ſweet, are found in plenty upon this iſland; and the marmalade made of its *guavas* is inferior to none. The *cocoa-nut*, of which we have given a deſcription in treating of *Aſia*, grows here to ſuch perfection, that the *Indians* call it *God's-tree*, as producing both meat, drink, and clothing. But of all others the *cotton-tree* has of late been cultivated to moſt advantage, for no iſland in the *Weſt Indies* now exports cotton of a better quality, or in ſo great a quantity.

Horſes, *cows*, *aſſes*, *ſheep*, *deer*, *goats*, and *rabbits*, were probably introduced by the *Courlanders* and *Dutch*, and their breed are ſtill to be found on the iſland. Here are alſo the *pickery*, which reſembles a hog, *armadillos*, and *guanoes*.

Its ſhores abound with excellent fiſh, particularly with *turtle* of every kind, and *mullets* of a moſt delicious taſte, with other ſorts unknown in *England*; no iſland perhaps in the world can boaſt of ſuch variety of fowl.

The firſt attempt to ſettle it was made by the *Engliſh*. *William*, earl of *Pembroke*, obtained a grant of it from *Charles* I, at the ſame time that he was inveſted with that of *Barbadoes*, as we have already related; to ſolicit which he was induced by the repreſentations of *Sir William Courteen*; but the earl of *Carliſle* ſoon after procuring that grant to be ſet aſide, no effectual attempts were made by that nation to eſtabliſh a colony. The *Dutch* then took poſſeſſion of the iſland, and gave it the name of *New Walcheron*, from one of largeſt iſlands in the province of *Zealand*; but they were ſoon diſpoſſeſſed by the natives, whom the *Spaniards* had ſtirred up. Some time after, the Duke of *Courland* conveyed a colony of his ſubjects hither, and ſucceeded ſo well in gaining an eſtabliſhment, that the *Dutch*, unwilling to loſe the poſſeſſion of this valuable iſland, revived their claim, made a ſettlement, and at length ſubdued the *Courlanders*. The court of *France* then aſſuming a right in the iſland, the *Dutch*, who were ſettled upon it, agreeing to acknowledge ſubjection to the *French* king, were permitted to retain their lands and effects; but ſome *Engliſh* privateers, in the reign of *Charles* II. deſtroyed the *Dutch* forts, and diſperſed the colony: theſe held it but a ſhort time. It was frequently attacked and paſſed from one power to another, until by the peace of *Nimeguen*, in the year 1674, it was aſſigned to the *Dutch*; but three years after the count *D'Etrees*, vice-admiral of *France*, attacked the iſland, and, after a very ſevere conflict, reduced it.

By the treaty of *Aix la Chapelle*, *Tobago* was declared a neutral iſland; but it was too valuable a ſpot to be long retained by the native inhabitants. The *French* made attempts to ſettle upon it, but they were oppoſed by the *Engliſh*, particularly by the honourable *Henry Grenville*, then governor of *Barbadoes*, who cauſed the deſign to be abandoned. By the 9th articles of the treaty of *Paris*, in 1763, it was ceded to the *Engliſh*, who cultivated it very ſucceſsfully, whilſt they held it, and raiſed it to a very conſiderable ſettlement; but it was taken by the *French* in the year 1781; and by the 7th article of the peace of *Verſailles*, in 1783, was ceded and guaranteed to that crown.

CAYENNE, *or* EQUINOCTIAL FRANCE,

EXTENDS two hundred and forty miles along the coaſt, and three hundred miles within land; it being bounded on the N. and E. by the *Atlantic* ocean, on the S. by *Amazonia*, and on the W. by the *Maroni* river, which ſeparates it from *Surinam*.

All the coaſt is very low, but within land there are fine hills, very proper for ſettlements; the *French* have, however, not yet extended them ſo far as they might; but they may raiſe the ſame commodities as thoſe they have from the *Caribbee Iſlands*, and in no inconſiderable quantities.

The ISLE of CAYENE is ſeated at the mouth of a river of the ſame name, in 4°. 56′. N. latitude, and 52°. 15′. W. longitude, from *Greenwich*. It is about forty-five miles in circumference. The *French* have a fort oppoſite the road, on a little riſing ground at the point of the iſland; but though it is conveniently ſituated, it wants freſh water, of which they can have none but the rain they ſave in ciſterns. There are in the iſland ſeveral meadows which produce very good graſs. The principal commodities of the iſland are *ſugar* and *roucou*, for they have neglected the cultivation of indigo. However, ſince the year 1722, they began to plant *coffee-ſhrubs*, and the coffee-berries are brought to be nearly as good as thoſe of *Arabia*. The *French* who ſettled here about the year 1635, built the fort which they called *St. Lewis*, and near it is a ſmall town conſiſting of two or three hundred houſes, inhabited by the ſoldiers of the garriſon, and by all ſorts of tradeſmen.

SECT. III.

The iſlands held by SPAIN in the WEST INDIES.

CUBA.

WE ſhall now treat of the inſular dominions which the *Spaniards* poſſeſs in this part of the world, deferring the account of their continental territories until we have completed our general deſcription of the Weſt Indies; in doing which the iſland of *Cuba*, from its magnitude and importance, as well as on account of its relative ſituation to the other iſlands, according to the method we have hitherto purſued, claims the firſt and moſt particular notice.

The iſland of *Cuba* is ſeated between 19° 48′ N. latitude and the tropic of *Cancer*, and between 74° 19′ and 84° 42′ W. longitude; it extends ſix hundred and ſixty miles in length from *Cape St. Antonio*, on the W. to *Cape Maize* on the E. but is very narrow in proportion, its broadeſt part being thirty-ſix leagues, and its general breadth not more than eighteen. It is twenty-five leagues to the N. of *Jamaica*, twenty leagues to the W. of *Hiſpaniola*, and thirty-three to the S. of *Cape Florida*, commanding the entrance of the gulfs of *Mexico* and *Florida*, and of the windward paſſage. The Abbé *Raynal* very juſtly ſpeaks of it as equal in value to a kingdom. *Hiſt. Politique, Liv.* XII.

The natives had given it the name of *Cuba* before it was diſcovered by *Columbus*, who at firſt called it *Juanna*, from Don *John*, and afterward *Ferdinandino*, from king *Ferdinand* V. who was king of Spain when this iſland was diſcovered; but it ſoon after recovered its *American* name of *Cuba*, which it ſtill retains.

A ridge of mountains runs almoſt through the iſland from E. to W. in which are mines of copper, that furniſh the *Spaniſh* plantations with the metal for all their braſs guns; and gold duſt being found in the ſands of the rivers, it is conjectured that there are veins of gold, if not of ſilver, in the mountains. Theſe mountains are ſhaded with trees, but the land near the ſhore is generally a plain champaign country. Abundance of rivulets run from the N. and S. ſides of theſe eminences; but none of them are large, for they fall into the ſea after a very ſhort courſe. No place in the world has better harbours, the chief of which are the *Havannah* on the N. W. which is one of the fineſt and moſt commodious havens in *America*; and that of *St. Jago*, which is at the bottom of a large bay, at the S. E. end of the iſland.

The rainy ſeaſon is in the months of July and Auguſt, when the ſun is vertical, and conſequently the weather would be extremely hot was not the ſun generally clouded, and the air refeſhed by the torrents of rain which then fall. The faireſt ſeaſon is when the ſun is moſt diſtant, and then the morning is much the hotteſt part of the day; for toward noon the ſea-breeze begins to blow ſomewhat briſkly, and thus continues till the evening. The trade winds in theſe ſeas blow from the N. E. At the full and change of the moon, from October to April, they have briſk N. or N. W. winds, which in December and January frequently become ſtorms, though this is uſually called the fair ſeaſon.

This iſland has a moſt prolific ſoil, and produces all the commodities raiſed in the *Weſt Indies*, particularly *ginger*, *long pepper*, and other ſpices, *caſſia fiſtula*, *maſtic*, and *aloes*. Here are large *cedars*, and other odoriferous trees, *oaks*, *pines*, *palm-trees*, *vines*, and *cotton-trees*. There are two ſorts of fruit here, called *camitor* and *guanavana*; the firſt reſembles a *China* orange, and grows on a tree which has a leaf green on one ſide, and a leaf of a cinnamon colour on the other. The other is in the form of a heart, green without, and with ſome thorny prickles within: it has alſo ſome ſtones, and a tart juice. Their other fruits are *plantanes*, *bananas*, *guavas*, *lemons*, &c. here are alſo many large walks of *cocoas*. The country produces *tobacco* and *ſugar*, ſaid to be the beſt in the *Weſt Indies*, though in no great quantity, for want of hands to cultivate the canes, but their ſugar-works have both water-mills and horſe-mills.

The animals formerly brought hither by the *Spaniards*, have multiplied to ſuch an extraordinary degree, that numbers have run wild in the woods. The ſhores abound with ſea fowl, particularly with a ſpecies of crane, white when young, but which is party coloured when old. Here are likewiſe large turtle, and the ſeas and rivers abound with *alligators*. The fiſh are chiefly *barbel* and *ſhads*.

This iſland, though capable of producing in the greateſt abundance and perfection every thing which the earth, by the labour and ſkill of man, can be brought to render, is ſo entirely neglected, in reſpect to its cultivation, by the *Spaniards*, that very inconſiderable exports are made from thence. It has been deſcribed as having more churches than plantations, more prieſts than planters, and more lazy bigots than labourers.

Here are many conſiderable towns; though *St. Jago* ſtill retains the name of the capital, it is greatly inferior to the *Havannah*, which is by far the fineſt city on the iſland.

The HAVANNAH is ſeated on the N. W. coaſt of the iſland, in 23° 12′ N. lat. and in 82° 18′ W. long. from *Greenwich*. It was built by *Diego de Velaſquez*, who landed here in the beginning of the ſixteenth century with three hundred *Spaniards*, and, with the aſſiſtance of *Bartholomew de las Caſas*, conquered *Cuba*. The latter, after becoming a *Dominican* friar, was made biſhop of *Chiapa*, in *New Spain*, and diſtinguiſhed himſelf greatly by his zeal in the cauſe of humanity; and from him we have the hiſtory of the *Spaniſh* cruelties, both here and in other parts of the *Weſt Indies*. Its port is ſaid to be the beſt and moſt frequented of any in the iſlands, and one of the fineſt in the world; it being ſo large that a thouſand ſail of ſhips may commodiouſly and ſafely ride in it without either anchor or cable, being expoſed to no wind. It is ſo deep, that the largeſt veſſels anchor at a ſmall diſtance from the ſhore. The entrance, which has no bar to obſtruct it, is by a channel about three quarters of a mile in length, but ſo narrow, that only one ſhip can go in at a time. The harbour into which it leads at the N. W. corner, is a long ſquare lying N. and S. the other three corners forming thee creeks or bays.

The city ſtands in the moſt fertile part of the iſland, on the W. ſide of the harbour, in a delightful plain that extends along the ſhore, and to the S. it is waſhed by two branches of the river *Lagida*. It is of an oval form, and begins about a quarter of a mile from the mouth of the harbour. The buildings, which are of ſtone, are very handſome, but not lofty, and the ſtreets are narrow, but clean. Here are eleven churches and monaſteries, two handſome hoſpitals, and a fine ſquare in the middle of the town, encompaſſed with uniform buildings. The churches, which are magnificent, are richly adorned, the lamps, candleſticks, and ornaments for the altars, being of gold and ſilver. Some ſilver lamps of moſt curious workmanſhip, are ſo large as to weigh two hundred marks, each mark being half a pound. The church of the Recollects has twelve beautiful chapels, and in their monaſtery are cells for fifty fathers. *St. Clare*'s church has ſeven altars, all adorned with plate: here is a large nunnery. The church of the *Auguſtines* has thirteen altars, and that of *St. John de Dieu* nine altars, with an hoſpital for ſoldiers, that has a revenue of 12,000 pieces of eight.

The city, on the land ſide, is encompaſſed with a wall defended by baſtions, and a caſtle on the ſide toward the harbour; at the harbour's mouth are alſo two ſtrong caſtles to defend its entrance: the ſtrongeſt of theſe has lines, which extend to the caſtle firſt mentioned, and is called the *Moro fort*: it is built on a rock at the foot of two hills, in which is cut a deep ditch, into which the ſea flows. At the point between this caſtle and the ſea is a tower, from which ſignals are thrown out on the approach of any ſhip. The other caſtle at the harbour's mouth is called the *Puntal*, and ſtands oppoſite to the *Moro*. It is a regular fortification, with four good baſtions well planted with cannon. There is a third fort called *El Fuerte*, or, *The Fort*, by way of eminence: it is a ſmall but ſtrong work toward the end of the narrow channel, with four regular baſtions, and another platform mounted with about ſixty large braſs cannon. Beſide theſe three forts there are two others, each of twelve guns, which ſtand on the ſhore four or five miles from the port. That to the E. is called *Coxemar*, and that to the W. *Bariavans*. Theſe forts have in the whole one hundred and twenty guns.

This city is of more importance to the *Spaniards* than any other in *America*, it being the place of rendezvous for all their fleets in returning from the *American* continent to *Spain*; and from its lying at the mouth of the gulf of *Florida*, through which they are all obliged to paſs; it has been called by the *Spaniards*, the key of the *Weſt Indies*. Here the *Spaniſh* navy aſſemble, and here the merchants ſhips or galleons, from the ſeveral *Spaniſh* ports, both of the continent and iſlands, repair, in the month of *September*, to take in proviſions and water, in order to return to *Spain* in one collected fleet. Within the city is a continual fair till their departure, which is generally before the end of the month, when proclamation is made, forbidding any perſon belonging to the fleet to ſtay in the town on pain of death, and upon firing a warning gun, every one goes on board.

ST. JAGO is ſeated in 20°. 10'. N. latitude, and in 76°. W. longitude, at the bottom of a ſpacious bay, on the S. E. ſide of the iſland, about ſix miles from the ſea. The entrance to the bay is narrow, and within it are ſmall iſlands, which ſhelter it from ſtorms, and form a commodious harbour. It is a biſhop's ſee, and has a cathedral; it had once alſo a good trade, which is now removed to the *Havannah*, and although this city has juriſdiction over one half of *Cuba*, it has become inconſiderable.

Though this iſland was diſcovered in 1492, it was not completely conquered till the year 1511. The natives were treated with all the cruelty that the united paſſions of ſavage bigotry, ſuperſtition, and avarice, could invent; and it is ſaid that ſome millions of them were cut off, and that at laſt orders were ſent from the court of *Spain*, to exterminate the few remains of its original inhabitants, which was accordingly executed with barbarous punctuality; ſo that the hiſtory of *Cuba* is no other than a relation of the moſt horrible maſſacres, which were induſtriouſly concealed by the *Spaniards*; for theſe monſters finding gold upon the iſland, concluded that it muſt come from concealed mines, and therefore tortured vaſt numbers of the natives to make them diſcover where theſe mines lay; and it is ſaid, that in the ſingle year when the governor *Velaſquez* arrived on the iſland, no fewer than ſix hundred thouſand of the natives were put to death.

The houſes of the *Havannah*, when that city was firſt built, were of no better materials than wood, and it was ſo inconſiderable a place in the year 1536, that it was taken by the crew of a *French* pirate ſhip, who obliged the inhabitants to pay ſeven hundred ducats to ſave their town from being burnt. The very day after the pirates departed, three *Spaniſh* ſhips from *Mexico* arrived at the *Havannah*, and, having unladen their cargoes, ſailed in purſuit of the pirate ſhip; but ſuch was the cowardice of the *Spaniſh* officers, that the pirate took all their three ſhips, and returning to the *Havannah*, obliged the inhabitants to pay down ſeven hundred ducats more. Many other predatory invaſions were made, both by the *French* and *Engliſh*, during the century which elapſed after its diſcovery.

The importance of the *Havannah* to the *Spaniards* was never thoroughly underſtood till after the ſucceſſion of the houſe of *Bourbon* to the throne of *Spain*; after which it gradually became a place of ſtrength, and every endeavour was uſed to render it impregnable.

In July 1741, admiral *Vernon* and general *Wentworth* landed on the S. E. part of the iſland, with a ſquadron of ſhips, made an encampment, and erected a fort on the ſhore, to which they gave the name of *Cumberland* harbour and fort. They continued there till almoſt the end of November following, when the ſickneſs of the men obliged them to abandon the iſland. Admiral *Knowles* made a like attempt in 1747, which proved equally ineffectual.

When the court of *Spain*, in the year 1761, was deluded into an alliance with *France*, then at war with *Great Britain*, and became a party in the quarrel, the *Britiſh* cabinet determined on attempting the reduction of this important poſſeſſion; for which purpoſe a very formidable armament was collected: the naval force, which conſiſted of nineteen ſhips of the line, eighteen frigates or ſloops, and one hundred and fifty tranſports, was commanded by Sir *George Pococke*: the land forces, which was compoſed of regulars and provincials, amounting to fourteen thouſand men, was entruſted to the earl of *Albemarle*. The landing was effected on the 6th of June, 1762, but the reduction of the *Moro fort*, which was the key to the town, proved to be a ſervice of the greateſt difficulty, and was at length effected by dint of bravery, but with very conſiderable loſs, occaſioned rather by the hardſhips endured than by the annoyance of the enemy. The ſurrender of the town of the *Havannah* followed on the 13th of *Auguſt*.

The poſſeſſion of a country enjoying ſuch uncommon advantages of ſoil and climate, and furniſhing, by its extent, the moſt ample ſcope for the ſucceſsful exerciſe of induſtry and talents, was conſidered by thoſe, who, at that time, influenced the meaſures of the *Britiſh* cabinet, as politically improper and dangerous; therefore, by the peace which took place in the next year, this iſland was, by the 19th article of the treaty, reſtored to *Spain*.

PORTO RICO.

THE next iſland belonging to *Spain*, is that of *Hiſpaniola*, but as the moſt valuable part of it belongs to the *French*, we have placed it among the *American* iſlands ſubject to *France*. We now, therefore, come to the laſt of the great *Antilles*.

PORTO RICO was diſcovered by *Columbus*, and received from him the name of *St. John*; but the chief town being afterward built upon a harbour called *Rico* or *Rich*, as is ſuppoſed, from its excellence, the whole iſland has ſince obtained the name of *Porto Rico*. It is ſituated between 18°. and 18°. 40'. N. latitude, and between 65°. 36'. and 67°. 45'. W. longitude, lying about eighteen leagues from the N. E. point of *Hiſpaniola*; extending forty leagues from E. to W. and about twenty leagues where broadeſt.

The ground is beautifully diverſified with woods, vallies, and plains, and is extremely fertile. It abounds with fine meadows, and a ridge of mountains runs through the iſland from E. to W. The N. part, which is more barren than the S. has been repreſented by travellers as having mines of *quickſilver*, *tin*, and *lead*, with ſome of *gold* and *ſilver*; but there are none of the latter worked at preſent. It is well watered with ſprings and rivers, and there are reckoned no leſs than twenty-three that fall into the ſea on the N. or S. ſides.

The *Manchaneel* tree, which is the moſt deadly of all the venomous ſpecies of trees, flouriſhes in the ſoil of *Port Rico* more than on any other ſpot where it is found. Its trunk, which is never more than two feet in circumference, is covered with a ſmooth tender bark. Its flowers are of a reddiſh caſt; its fruit is of the colour of a peach, and has a ſtone in the middle. The leaves of it are like thoſe of the laurel, and contain a milky fluid. In the heat of the day it is dangerous to handle them, on account of the moiſture which exudes from their pores, and ſtill more dangerous to repoſe under them, from the prodigious quantity of duſt that falls from the innumerable flowers borne by theſe trees. Inciſions being made in the trunk of them, ſhells are placed under to receive the ſap; which, when it becomes ſomewhat thick, the natives ſteep the points of their arrows in it, which acquire from thence ſuch a poiſonous quality, that the ſlighteſt wound which they inflict proves mortal; but the fleſh of animals killed by theſe poiſoned weapons may be eaten without any ill effect. Salt applied immediately to the wound is an effectual antidote to the effects of this poiſon; a weapon thus impregnated has been found to retain its venomous quality above a hundred years.

The *Abbé Raynal* makes the number of inhabitants on *Porto Rico* to amount to no more than 1500 *Spaniards*, *Meſtees*, and *Mulattoes*, with about 3000 negroes. The *Aborigines* of the country, who are ſaid to have amounted to 4 or 500,000, were cruelly extirpated by the *Spaniards*; but ſuch barbarous proceedings by no means promoted the intereſts of *Spain*. An iſland of conſiderable extent, enriched by a great number of rivers, fruitful though unequal, furniſhed with an excellent port, and coaſts of eaſy acceſs; this iſland, which if held by an active nation, would riſe to great conſequence, is ſcarcely known in the world!

The city of ST. JOHN is ſeated on the N. ſide of the iſland, in a peninſula which joins to the main land by a cauſeway in 18°. 20′. N. latitude, and 65°. 35′. W. longitude, from *London*. It is both the ſeat of the governor and the ſee of a biſhop. The cathedral has a monaſtery belonging to it; but the heat of the climate renders it inconvenient to make uſe of glaſs-windows, and their canvaſs and wooden lattices disfigure their buildings. The city is defended by a citadel and a caſtle.

In 1595, Sir *Francis Drake* burnt the ſhips in the harbour of *St. John*, and three years after the town was reduced by the earl of *Cumberland*, who fitted out a fleet at his own expence, in which were two regiments of queen *Elizabeth*'s troops. He conquered the town with great difficulty, and had thoughts of keeping it; but loſing four hundred of his men, who died of the bloody flux in the courſe of a month, he abandoned it, after demoliſhing the forts: he carried off eighty pieces of braſs cannon and a great quantity of plate. In 1615 it was taken and plundered by the *Dutch*; but they were not able to reduce the caſtle.

TRINIDAD *and* MARGARETTA.

THERE are ſeveral other ſmaller iſlands belonging to *Spain* in this ſea, particularly *Trinidad*, or *Trinidada*, which is ſeated from 9°. 22′. to 10°. 20′. N. latitude, and from 60°. 30′. to 61°. 30′. W. longitude, forming one ſide of the ſtraits of *Paria*, or *Bocca del Drago*, and *New Andaluſia* in *Terra Firma*. It is about ſixty-two miles in length, and forty-five in breadth. The ſoil is fruitful, producing *ſugar*, fine *tobacco*, *Indian corn*, variety of fruit, and ſome *cotton-trees*. It was taken by Sir *Walter Raleigh*, in 1595, and by the *French*, in 1676, who plundered the iſland, and inhabitants.

About 5°. W. of *Trinidad* is MARGARETTA, which is ſeated near the northern coaſt of *New Andaluſia*, from which is ſeparated by a ſtrait twenty-four miles broad. It is fifteen leagues in length, ſix in breadth, and as it is always verdant, affords a very agreeable proſpect. The iſland is very fertile; abounding with paſtures, maize, and fruit, and has many groves. A great number of boats were formerly employed here in fiſhing for pearls; but this fiſhery is much declined, if not diſcontinued.

ST. CATHARINE'S.

THIS is the principal iſland on the coaſt of the ſouthern part of *Braſil*. It is no where above ſix miles in breadth, though about twenty-ſeven in length, extending from 27°. 35′. S. latitude to 28°. and lying in 49°. 17′. W. longitude from *Greenwich*.

Though it is of a conſiderable height, it is ſcarce perceivable at ten leagues diſtance, it being then obſcured by the continent of *Braſil*, the other mountains there riſing exceeding high; but on a nearer approach it is eaſily diſtinguiſhed, and may be known by a number of ſmall iſlands lying at each end, and ſcattered along the E. ſide of it. The harbour is defended by ſeveral forts.

The ſoil is truly luxuriant, ſpontaneouſly producing fruits of many kinds, and the ground is covered with one continued foreſt of trees of a perpetual verdure, which from the exuberance of the mould, are ſo entangled with briars, thorns, and underwood, as to form a thicket abſolutely impenetrable, except by ſome narrow paths which the inhabitants have made for their own accommodation. Theſe, with ſome ſpots cleared for plantations along the ſhore facing the continent, ſeem the only uncovered parts of the iſland. The woods are extremely fragrant, from the many aromatic trees and ſhrubs which they abound; and the fruits and vegetables of all climates thrive here, almoſt without culture, and are to be procured in great abundance.

The fleſh proviſions are, however, much inferior to the vegetable; there are indeed to be purchaſed ſmall wild cattle, ſomewhat like buffaloes; but theſe are very indifferent food, their fleſh being of a looſe contexture, and generally of a diſagreeable flavour, owing, perhaps, to the wild calabaſh on which they feed. There are alſo great plenty of pheaſants, but they are far inferior in taſte to thoſe in *England*. Fiſh, of various ſorts, abound in the harbour, are extremely good, and eaſily caught.

The water both on the iſland and of the oppoſite continent is excellent, and keeps at ſea as well as the water of the *Thames*; for after it has been in the caſk a few days it purges itſelf, ſtinks intolerably, and is ſoon covered with a green ſcum, which ſoon ſubſiding, leaves the water as clear as cryſtal, and perfectly ſweet.

Theſe are the advantages of the iſland; but it has ſeveral inconveniencies, particularly with reſpect to the climate; for the woods and hills which ſurround the harbour, prevent a free circulation of air; and the vigorous vegetation which conſtantly takes place there, furniſhes ſuch a prodigious quantity of vapour, that all the night, and a great part of the morning, a thick fog covers the whole country, and continues till either the ſun becomes ſufficiently powerful to diſſipate it, or a briſk ſea-breeze diſperſes it. This renders the place cloſe and humid. Strangers are here alſo much peſtered with a multitude of muſkettoes, which are all day extremely troubleſome, and at ſun-ſet, when they retire, an infinite number of ſand-flies ſucceed, which, though ſcarce perceivable to the naked eye, make a buzzing noiſe, and wherever they bite, raiſe a ſmall bump in the fleſh, and excite a painful itching, like that ariſing from the bite of an *Engliſh* harveſt bug.

This iſland was ſubject to a governor appointed by the king of *Portugal*, with a garriſon of ſoldiers for its defence; but on the firſt day of February, 1777, a large *Spaniſh* fleet, conſiſting in the whole of 116 ſail, commanded by the Marquis of *Caſa Tilly*, and 9000 land forces, under Don *Pedro de Cevallos*, attacked the place. The *Portugueſe* governor, Don *Antonio de Mendoza*, had 4000 *European* troops beſides *Indian* auxiliaries, and the iſland was ſtrong both by art and nature. Notwithſtanding which, a very feeble defence was made, the *Spaniards* ſoon poſſeſſed themſelves of every faſtneſs, and the *Portugueſe* ſurrendered themſelves priſoners of war; whereby the crown of *Spain* acquired a very valuable poſſeſſion.

We ſhall conclude this ſection, and our account of the *Spaniſh Weſt-India* iſlands, with ſome obſervations on the conduct of the *Spaniards* in the ſettlement of them.

The *Spaniards*, by a ſeries of the moſt inhuman and impolitic barbarities, having exterminated the original inhabitants of *Cuba*, *Hiſpaniola*, and *Porto Rico*, have left them comparatively ſo many deſerts, and deprived themſelves of a thouſand advantages they might have enjoyed by an equitable trade with the natives. The commerce between the iſlands and the *Spaniſh* continent is carried on by the *Barlevento* fleet, conſiſting of ſix ſhips of good force and burden, who annually make the tour of *Cuba*, *Hiſpaniola*, *Porto Rico*, and the coaſt of *Terra Firma*, not only to carry on the commerce between them, but to clear the ſea of pirates and illicit traders; and now and then a regiſter ſhip from *Spain* is bound to one or other of them. The *Spaniards* have hitherto ſeemed to keep poſſeſſion of them, rather to prevent any other nation growing powerful in thoſe ſeas, than from the profit they expected to derive from them; for it is certain, that ſhould any other nation obtain the poſſeſſion of all theſe iſlands, the trade of the *American* continent, and perhaps the continent itſelf, would be entirely at their mercy. The *Spaniards* have, however, lately taken ſome ſteps toward the better ſettlement of *Porto Rico*; and are beginning to open the *American* trade to ſome other towns in *Spain*, beſide *Cadiz*.

"Hitherto," ſays an ingenious author, "the tide of wealth that conſtantly flowed from *America* into *Spain*, has ran through that kingdom like a haſty torrent, which, far from enriching the country, hurried away with it all the wealth it found in its paſſage. No country in *Europe* has received ſuch vaſt treaſures as *Spain*: in no country in *Europe* is ſeen ſo little money; for from the time that the *Indies* fell into the hands of *Spain*, the affairs of that monarchy have been conſtantly going backward. In *America* their ſettlements were carried on conformably to that genius, and to thoſe maxims which prevailed in their government in *Europe*. No means of retaining their conqueſts but by extirpating the people; no ſchemes for the advancement of trade; no attempts at the reformation of abuſes which became venerable in proportion to the miſchiefs they had ſuffered by them; in government tyranny; in religion, bigotry; in trade, monopoly.

"When the *Spaniards* found, that to their ambition, which was boundleſs, they had joined a treaſure which was inexhauſtible, they imagined there was nothing too vaſt for them to compaſs. They embraced a thouſand projects at once; many of them noble in theory, but to be executed with different inſtruments in different parts of the world, and all at a vaſt expence of blood and treaſure. The wars, which were the reſult of theſe ſchemes, and the *Indies*, which were to ſupport them, were a continual drain, which carried off their people, and deſtroyed all induſtry in thoſe who remained. The treaſure which flowed in every year from the New World, found them in debt to every part of the Old; for to the reſt of their revenues they had forgot to add, that which is a great revenue itſelf, and the great ſupport of all the others, œconomy. On the contrary, an ill order in their finances at home, and a devouring uſury abroad, ſwallowed up all their treaſure, whilſt they multiplied the occaſions for it. With the beſt ſcheming heads in *Europe*, they were every where out-rivalled; with brave and well-diſciplined troops, they were almoſt always defeated; with the greateſt treaſures, they were in want; and their armies were ill provided, and ill paid. Their friends exhauſted them by trade; their enemies by plunder. They ſaw new ſtates ariſe out of the fragments of their dominions; and new maritime powers ſtart up from the wrecks of their navy. In ſhort, they provoked, troubled, and enriched all *Europe*; and at laſt deſiſted through mere want of ſtrength. They were inactive, but not quiet; and they were enervated as much by their lazineſs, during this repoſe, as they had been weakened before by their ill-judged activity. At preſent the politics of *Spain*, with regard to *America*, ſeem to be to preſerve *South America*, and particularly the navigation of the *South Seas*, as much as poſſible to themſelves; to deſtroy effectually the contraband trade, and to encourage the export of their own manufactures." *Account of the European Settlements in America*, I. 296.

SECT. IV.

The Iſlands of the West Indies poſſeſſed by the Dutch and Danes.

St. Eustatia, *or* St. Eustatius, Saba, *and* St. Martin's.

St. Eustatia is ſituated three leagues N. W. of *St. Chriſtopher's*, in latitude 17°. 29′. N. longitude 63°. 10′. W. of *Greenwich*. It conſiſts of a mountain riſing out of the ſea like a pyramid, but almoſt round. The air is wholeſome, but the iſland is ſubject to terrible ſtorms of thunder, hurricanes, and earthquakes. Its chief produce is *tobacco*, and the *Dutch* are ſaid to have here five thouſand white people, and fifteen thouſand negroes. Its ſituation renders it the ſtrongeſt of all the *Caribbee Iſlands*, there being but one good landing-place, which may be eaſily defended by a few men, and the haven is commanded by a fort mounted with guns. It is only the very top of the mountain that is covered with wood; for though this iſland is ſo ſmall, and inconveniently laid out by nature, the induſtry of the *Dutch* has made it turn out to very good account; for it is fully peopled; and the ſides of the mountain are divided and laid out into neat plantations, in which they raiſe ſugar and tobacco. On the ſummit is a pretty large plain, which harbours wild beaſts. In this, as well as in ſeveral of the adjacent iſlands, there is neither river nor ſpring of freſh water, but the inhabitants are ſo careful, that they never want proper ſupplies of water from their ponds and ciſterns which receive the rain. There are ſeveral ſtore-houſes well ſupplied with all neceſſaries, and particularly with *European* commodities, which they ſell to their neighbours at a very advanced price, whenever ſupplies from *Europe* fail; they alſo carry on a contraband trade with the *Spaniards*.

The *Dutch* took poſſeſſion of this iſland in 1635, and the States granted it to certain merchants of *Fluſhing*, who ſoon ſettled a colony upon it of about ſix hundred families. In 1665 it was conquered by the *Engliſh*, but was ſoon after retaken by the united forces of the *French* and *Dutch*, after which it had a *French* garriſon: but it was reſtored to the *Dutch* by the treaty of *Breda*. In 1689 it was conquered by the *French*, from whom it was taken the very next year by the *Engliſh*, under Sir *Timothy Thornhill*, who allowed the *French* only their lives and their baggage. The iſland was again reſtored to the *Dutch* by the treaty of *Ryſwic*.

When the war between *Great Britain* and her *American Colonies* had given riſe to a rupture with *France*, *St. Euſtatius*, by being a neutral port, was the mart for a prodigious trade, and the depoſitary of immenſe quantities of merchandize as well as ſpecie. The inconveniences felt by the *Engliſh* from the ready ſupply which their enemies received of warlike and naval ſtores, and the opportunity which it afforded of conveying the produce of their iſlands to *Europe* in neutral veſſels, cauſed the iſland to be attacked by the *Engliſh*, as ſoon as they commenced hoſtilities with the republic of *Holland*. It was taken by admiral (now lord) *Rodney*, and general *Vaughan*, in *February* 1781, the governor ſurrendering the place on the firſt ſummons. Upward of one hundred and fifty veſſels, many of them richly laden, were taken in the bay, together with a *Dutch* frigate, and five ſhips or veſſels of war: many very valuable captures were alſo made afterward. The ſmall and adjacent iſlands of *Saba* and *St. Martin* were likewiſe reduced. The next year, the *French*, commanded by *M. de Bouille*, governor of *Martinico*, made a conqueſt of *St. Euſtatius*, with as much eaſe as the *Engliſh* had poſſeſſed themſelves of it. The three iſlands have ſince been reſtored to the *Dutch*.

SABA is a ſmall but pleaſant iſland, thirteen miles N. W. of *Euſtatia*, and thirty S. W. of *St. Bartholomew*. Longitude 63°. 17′. W. from *Greenwich*, latitude 17°. 39′. N. It is four or five leagues in compaſs, and is ſaid to have formerly belonged to the *Danes*. At firſt ſight it ſeems only a rock; but a *Dutch* colony ſent from *St. Euſtatia* to manure it, found in it a valley ſufficient to employ and ſubſiſt many families; but it has the inconvenience of having no port. The fiſhing about it, eſpecially for the *boneto*, is very plentiful, and it is in no want of neceſſary refreſhments. The ſea on its coaſts is ſo ſhallow, that ſtones may be ſeen at the bottom, and nothing but ſloops can approach. There is a road cut from the top of the rock to the bottom; but it is ſo ſteep, that it reſembles an impregnable fortification formed by the hand of nature. The inhabitants, for their greater ſecurity, have, in many places, by the ſide of the rock, piled up heaps of ſtones on ſcaffolds, ſo diſpoſed, that by only pulling a rope the ſcaffolds fall, and inſtantly diſcharge ſuch a ſhower of ſtones, as is ſufficient to overwhelm a whole army. The *French Buccanneers* ſurpriſed, and had well nigh maſtered, this iſland in the year 1688, but finally miſcarried. *Labat* ſays, when he was here in 1701, the iſland was divided into two parts, containing no more than about fifty families, who lived in genteel, convenient, and well furniſhed houſes, but traded for the moſt part in ſhoes; by making which, and raiſing indigo and cotton, they purchaſed ſlaves, good furniture, and lived in eaſy circumſtances.

ST. MARTIN's is ſeated in 18°. 4′. N. latitude, and 63°. 2′. W. longitude from *Greenwich*; between *Anguilla*, on the N. and *St. Bartholomew* on the S. E. about fifteen miles from each, and is twenty-one miles in length, twelve in breadth, and forty-two in circumference. It has commodious bays and roads on the N. W. ſide, with ſome good ſalt-pits, and lakes of ſalt water, which run a great way within the land, and abound with good fiſh and turtle; but the iſland has no freſh water, except what comes from the clouds, and is ſaved in ciſterns.

In this iſland are ſeveral trees, from whence diſtil various gums; with plenty of the *candle-wood-tree*, the ſmall ſticks of which, when dry, are lighted up inſtead of candles, and yield a very fragrant ſmell, ariſing from the gum contained in the wood. The *tobacco* of *St. Martin*, which is eſteemed the beſt in the *Caribbees*, is the chief object of culture to the inhabitants.

Formerly the *Spaniards* kept a garriſon here, to prevent other nations ſettling on the iſland; but about the year 1650, they blew up their fort, deſtroyed their ciſterns, burnt their houſes, and abandoned the place. Then came the *French* and *Dutch*, and ſharing the iſland between them, lived very friendly together, and had their particular churches in their reſpective quarters. The *French* had that part next *Anguilla*, which was in every reſpect the moſt elegible; and the other ſide of the iſland, in which the *Spaniſh* fort had ſtood, remained in the poſſeſſion of the *Dutch*, by virtue of the partition-treaty made between the two nations: but in 1744 ſome *Engliſh*, under the deputy-governor of *Anguilla*, aſſiſted by two privateers from *St. Chriſtopher*'s, drove the *French* out of their part of the iſland, and took poſſeſſion of it themſelves, ſince which time it has belonged to the *Engliſh* and *Dutch*.

CURASSOU, *or* CURACAO, BONAIRE, *and* ARUBA.

THE iſland of CURASSOU, or CURACAO, is the only place of importance poſſeſſed by the *Dutch* in the *Weſt Indies*. The northernmoſt point is in 12°. 45′. N. latitude, and 69°. W. longitude, about twenty-five leagues from the continent, and the iſland is about thirty miles long, and ten broad. It is the moſt weſtern of that range of iſlands called the LITTLE ANTILLES. At the E. end is a good harbour, called *Santa Barbara*; but the chief harbour is about three leagues from the S. E. end, where the *Dutch* have a very good town, and a ſtrong fort. Ships bound thither are obliged to keep cloſe to the harbour's mouth, and are hauled in by means of a rope, which is thrown from the ſhip to the ſhore; for there is no anchoring at the entrance of the harbour, and the current always ſets to the weſtward; but being thus brought in the port is very ſecure.

Though the ſoil here is naturally barren, it produces a conſiderable quantity both of *ſugar* and *tobacco*; and here are alſo very great *ſalt-works*: but the iſland is chiefly valuable on account of the contraband trade which is carried on with the *Spaniards*.

The *Dutch* ſhips from *Europe* touch at this iſland for intelligence, or proper pilots, and then proceed to the *Spaniſh* coaſts for trade, which they force with a ſtrong hand, it being very difficult for the *Spaniſh* guarda coſtas to take theſe veſſels; for they are not only ſtout ſhips, with a number of guns, but are manned with large crews of choſen ſeamen, deeply intereſted in the ſafety of the veſſels and ſucceſs of the voyage.

Curaſſou has numerous warehouſes, always full of the commodities of *Europe* and the *Eaſt-Indies*. Here are all ſorts of woollen and linen cloths, laces, ſilks, ribbons, iron utenſils, naval and military ſtores, brandy, the ſpices of the *Moluccas*, and the white and painted callicoes of *India*. Hither the *Dutch Weſt-India*, which is alſo their *African* company, annually bring three or four cargoes of ſlaves; and to this mart the *Spaniards* themſelves come in ſmall veſſels, and carry off not only the beſt of the negroes, for whom they give a very high price, but great quantities of all the above ſorts of goods. The *Spaniards* pay in gold and ſilver, coined or in bars, cacao, vanilla, *Jeſuit's* bark, cochineal, and other valuable commodities.

The trade of *Curaſſou*, even in time of peace, is ſaid to be annually worth to the *Dutch* no leſs than five hundred thouſand pounds ſterling; but in time of war the profit is much greater, for it is then in a manner the common emporium of the *Weſt-Indies*: it affords a retreat to ſhips of all nations, and at the ſame time refuſes none of them arms and ammunition.

This is far from being owing to any natural advantage whatſoever; for it ſeems as if it were the fate of the *Dutch* to be every where obliged, both in *Europe* and *America*, to exert their ingenuity and patience in ſubduing an unfriendly ſoil; for the iſland is not only barren, and dependent on the rains for its water, but the harbour is naturally one of the worſt in *America*. The *Hollanders* have indeed entirely remedied that defect: they have upon this harbour one of the largeſt, and by far the moſt elegant and cleanly, towns in the *Weſt Indian* iſlands; the public buildings are numerous and handſome, the private houſes commodious, and the magazines large, convenient, and well ſupplied. Almoſt all kinds of labour are here performed by engines, ſome of them ſo admirably contrived, that ſhips are at once lifted into dock, where they are completely careened, and then furniſhed with naval ſtores, proviſions, cannon, and every thing proper either for war or trade.

BONAIRE is ſeated in 68°. 10′. W. longitude, and the middle of the iſland is laid down in 12°. 16′. N. latitude. It is about twenty leagues from the continent, and is ſixteen or ſeventeen leagues round. The road is on the S. W. ſide near the middle of the iſland, where a pretty deep bay runs in. The inhabitants are chiefly employed in raiſing *maize* and *Guinea* corn, *yams*, and *potatoes*; and alſo in grazing.

Aruba, which alſo belongs to the *Dutch*, is ſeven or eight leagues to the weſtward of *Curaſſou*. The two laſt iſlands have no conſiderable trade, but are chiefly employed in raiſing freſh proviſions for the principal iſland, and for the refreſhment of ſuch ſhips as reſort to thoſe ſeas.

The trade of all the *Dutch American* ſettlements was originally carried on by the *Weſt-India* company alone; at preſent ſuch ſhips as go upon that trade pay two and a half per cent. for their licences; the company, however, reſerve to themſelves the whole of the trade carried on between *Africa* and the *American* iſlands.

The *Dutch*, alſo, poſſeſs extenſive territories on the continent of *South America*, to which we ſhall pay proper attention when we are treating of that diviſion of the globe.

St. Thomas *and St.* Croix.

St. Thomas, the principal iſland ſubject to the *Danes*, is ſituated in 18°. 22′. N. longitude, and in 64°. 51′. W. latitude. It has a ſafe and commodious harbour, in which are two mounds, that ſeem as if formed by nature for having batteries raiſed upon them. Though the iſland is only fifteen miles in circumference, it is ſubject both to the *Danes* and *Brandenburghers*, but the latter are under the protection of the former. Almoſt in the centre of the harbour is a ſmall fort, without ditch or outworks; and about fifty or ſixty paces to the W. of it begins the town, which chiefly conſiſts of one long ſtreet; at the end of which is the *Daniſh* factory, a large building, with convenient warehouſes both for the ſtowage of their commodities and for the reception of the negroes, in which they trade with the *Spaniards*. On the right ſide of this factory is the *Brandenburgh* quarter, which conſiſts of two little ſtreets, full of *French* refugees from *Europe* and the iſlands. Moſt of the houſes are of brick, built and tiled after the *Dutch* manner, but only one ſtory high, on account of the badneſs of the foundation; for at the depth of three feet, water and quickſand are generally found.

The iſland produces *oranges*, *citrons*, *lemons*, *guavas*, *bananas*, *mandiaca*, *millet*, *potatoes*, and moſt ſorts of fruit and herbage, particularly *ſugar* and *tobacco*; but it is much infeſted with muſketoes. Theſe iſlands, ſo long as they remained in the hands of the *Daniſh Weſt-India* company, were ill managed, and no advantage was made of them in any degree equal to what they were capable of; but that wiſe and benevolent prince, *Frederic* V. the late king of *Denmark*, bought up the company's ſtock, and laid the trade open: ſince that time the iſland of *St. Thomas* has been ſo greatly improved, that it is ſaid to produce upward of three thouſand hogſheads of ſugar at a thouſand pounds weight each, beſide other *Weſt-India* commodities. In time of war privateers bring in their prizes here for ſale, and a great many veſſels trade from hence along the coaſt of *Terra Firma*, and return with ſilver in ſpecie or bars, and valuable merchandize.

St. Croix is about five leagues E. of *St. Thomas*'s, eight from *Porto Rico*, and about thirty W. of *St. Chriſtopher*'s. It is ſeated in 18°. N. latitude, and in 65°. W. longitude. It is about ten or twelve leagues in length, and about three on the E. ſide where it is broadeſt. The air is extremely unhealthy, but this will probably continue no longer than till the woods, with which great part of the iſland is at preſent covered, are farther cleared, and a proper circulation of the air produced. The ſoil is black, eaſy to be cultivated, very fertile, and produces ſeveral kinds of fine trees proper for the joiner and cabinet-maker, with *ſugar-canes*, *oranges*, *lemons*, *pomegranates*, *citrons*, a ſort of *papay* called *mamee*, which is ſaid to bear once a month excellent fruit, ſhaped like a woman's breaſt, from whence it takes its name.

A large bay on the N. ſide contains a baſin and a ſmall iſland; and in another, on the S. ſide oppoſite to it, the country is indented by the ſea with ſo many inlets, that it ſeems one continued marſh, intermixed with a number of ſmall iſlands, whence it has been called "the drowned country."

The *Spaniards*, when they firſt became acquainted with this iſland, deſtroyed the natives, and, as in other places, ſoon after deſerted it, when it lay for a long time deſolate; but it had afterward ſeveral maſters in a ſhort compaſs of time: the *Engliſh* and *Dutch*, after diſputing the ſole poſſeſſion of it, ſhared it between them; but, in 1649, the *Engliſh* being moſt numerous, ejected their neighbours, and were ſoon after expelled themſelves by the *Spaniards* from *Porto Rico*, who burnt the houſes, put all the men they found in arms to the ſword, and tranſported the reſt, with their wives and baggage, to the iſland of *Barbuda*. The *Dutch* afterward drove out the *Spaniards*, and *M. de Poincy*, the *French* governor of *Martinico*, in the year 1657, purchaſed this iſland, together with thoſe of *St. Bartholomew* and *St. Martin*, of the *Dutch*, for the knights of *Malta*, of which order he was grand maſter. It was afterward purchaſed of thoſe knights by the *French Weſt-India* company; but the *French* abandoning it in 1696, the *Danes* obtained the poſſeſſion of it, and it belonged to their *Weſt-India* company till it was purchaſed by *Frederic* V. king of *Denmark*. Its chief conſequence ariſes from its being declared a free port.

C H A P. IV.

Of the SPANISH Dominions on the Continent of AMERICA; and firſt of NEW MEXICO, CALIFORNIA, and MEXICO, or NEW SPAIN, in NORTH AMERICA.

INTRODUCTION.

Of the SPANISH *Dominions on the* AMERICAN *Continent in general.*

HAVING already deſcribed the new acquiſitions made by *Spain* on the continent of *North America*, namely, the two *Floridas*, ceded by *Great Britain* in the treaty of 1783, and *Louiſiana*, obtained from the *French*, we ſhall now conduct our readers to the *Spaniſh* conqueſts both on the northern and ſouthern diviſions of that vaſt continent, which extend from 36°. N. to 53°. S. latitude, from the moſt northern part of *California* to the Straits of *Magellan*, a ſpace of between ſix and ſeven thouſand miles, the whole coaſt of which is on one ſide entirely *Spaniſh*; but on the other is *Braſil*, and a comparatively inconſiderable *French* and *Dutch* ſettlement. A great part indeed of this country is poſſeſſed by the natives, and ſome places lie deſolate; but *Spain* claims the dominion of the whole: however, it muſt be confeſſed, that only a very ſmall part of it is really cultivated by the *Spaniards*.

The climate in ſo great an extent of country muſt differ according to the latitude, and other circumſtances; and thus the general opinion, that the *Spaniſh American* dominions are unhealthy, is, like many other general propoſitions, at the ſame time both true and falſe. Thoſe colonies within or near the tropics are exceedingly hot, while others are remarkably cool: ſome places in the hot climate are both healthy and pleaſant, while others have an almoſt peſtilential air. Several of the provinces in *New Spain* and *Peru* are bleſſed with almoſt every advantage, and no country affords more delightful ſpots than are to be found in *New Mexico* in the N. *Buenos Ayres* in the S. and ſeveral other countries on both ſides the Line in the temperate zones. Where the lands have never been cleared, where the ſoil is marſhy and ſwampiſh, where periodical deluges of rain pour down from the heavens, the climate muſt neceſſarily be unhealthy, and all theſe afflict ſome of the *Spaniſh* dominions in *America*.

The ſoil differs no leſs than the climate: ſome countries conſiſt of the moſt beautiful lawns, paſtures, fields, and meadows, watered with fine ſtreams, ſhaded with groves, and variegated with hills and valleys; while others only preſent to the eye dreary deſerts, dreadful rocks, and mountains of a ſtupendous height, vaſt foreſts, and the moſt tremendous ſcenes of wild, rude, and uncultivated nature. Several of the *Spaniſh* plantations are wonderfully rich and fruitful, abounding in corn, the moſt beautiful paſtures, trees that afford fruit, ſhade, and ornament, odoriferous ſhrubs, medicinal plants, woods, and roots, with flowers delightful to the ſenſes; in ſhort, almoſt every thing that nature or art produces, in any quarter of the globe, may here be found growing ſpontaneouſly, or raiſed by labour, in its greateſt perfection. In the boſom of the earth have been found immenſe treaſures of gold and ſilver: this extenſive territory alſo produces *emeralds*, *pearls*, rich *drugs*, *dying woods*, *tobacco*, *ginger*, *coffee*, *cotton*, and *ſweetmeats*; and for the convenience of navigation, it is furniſhed with the nobleſt rivers in the world.

If we take a view of the country with reſpect to its inhabitants, we ſhall find the true cauſe why theſe colonies have proved of little ſervice to *Spain*. The impolitic expulſion of the *Moors* proved an irreparable blow to that monarchy; and the colonization of *America* increaſed the evil. Yet though *Spain* was almoſt depopulated by the conſtant migration of her people to the continent of *America* and the *Weſt India* iſlands, ſtill the number was very inadequate to the purpoſe of rendering the plantation populous and flouriſhing, eſpecially as the cruelty of the firſt conquerors had almoſt extirpated the natural inhabitants. When *America* was firſt reduced, it was thought neceſſary to eſtabliſh great numbers of eccleſiaſtics in the country, for the inſtruction of the natives in the Chriſtian religion; and theſe have ſince multiplied to ſuch a degree, as to have the moſt pernicious effect upon population. Every province is filled with monaſteries, nunneries, and perſons condemned by ſuperſtition to celibacy, and doomed by the tyranny of the church to be denied the gratification of the moſt natural paſſion. The ſpirit of avarice and oppreſſion which reigns among all the officers of the crown, who are generally choſen out of families of diſtinction, but of broken fortunes, ſenſibly affects the ſtate by prejudicing the revenues, diſcouraging induſtry, and extinguiſhing public ſpirit. What may be conſidered of ſtill greater importance, is, that the fondneſs the *Spaniards* have ſhewn for gold and ſilver, has been equally prejudicial to the colonies, and to the mother country; ſince it has not only prevented thoſe commodities and manufactures, which in themſelves would prove more valuable than the richeſt mines of gold and ſilver, but has diffuſed ſuch narrow and ſordid principles through the minds of the people, as are viſibly productive of the moſt fatal effects.

Baron *Monteſquieu*, after obſerving that from the time in which the *Spaniards* diſcovered the gold and ſilver of *America*, *Spain* has been inceſſantly declining, adds,

"Gold and ſilver are either a fictitious, or a repreſentative wealth. The repreſentative ſigns of wealth are extremely durable, and in their own nature but little ſubject to decay. But the more they are mutiplied, the more they loſe their value, becauſe the fewer are the things they repreſent.

"The *Spaniards*, after the conqueſt of *Mexico* and *Peru*, abandoned their natural riches in purſuit of a repreſentative wealth, which daily degraded itſelf. Gold and ſilver were extremely ſcarce in *Europe*, and *Spain* becoming ſuddenly miſtreſs of a prodigious quantity of thoſe metals, conceived hopes to which ſhe never before aſpired. The wealth found in the conquered countries, great as it was, did not, however, equal that of their mines. The *Indians* concealed a part; and beſides, theſe people, who made no other uſe of gold and ſilver than to give magnificence to the temples of their gods, and to the palaces of their kings, ſought not for it with an avarice like ours. In ſhort, they had not the ſecret of drawing the metals from every mine, but only from thoſe in which the ſeparation might be made by fire.

"However, it was not long before the ſpecie of *Europe* was doubled; this appeared from the price of commodities, which was every where doubled.

"The *Spaniards* raked into the mines, ſcooped out mountains, invented machines to draw out water, to break the ore, and ſeparate it; and as they ſported with the lives of the *Indians*, they forced them to labour without mercy. As the ſpecie of *Europe* ſoon doubled, the profit of *Spain* diminiſhed in the ſame proportion;

and they had every year the ſame quantity of metal, which was become by one half leſs precious.

"In double the time the ſpecie ſtill doubled, and the profit diminiſhed another half.

"It diminiſhed even more than one half: let us ſee in what manner.

"To extract the gold from the mines, to give it the requiſite preparations, and to import it into *Europe*, muſt be attended with ſome certain expence; I will ſuppoſe this to be as one to ſixty-four. When the ſpecie was once doubled, and conſequently became one half leſs precious, the expence was as two to ſixty-four. Thus the galleons, which brought to *Spain* the ſame quantity of gold, brought a thing which was really of leſs value by one half, though the expences attending it had been one half higher.

"If we proceed doubling and doubling, we ſhall find in this progreſſion the cauſe of the impotency of the wealth of *Spain*."—*L'Eſprit des Loix*, liv. xxi. cap. 18.

NEW MEXICO.

THE province of *New Mexico* will not admit of a very detailed account, its boundaries being by no means aſcertained, and the far greateſt part of it being ſtill in the hands of the natives, who have the happineſs yet to enjoy that invaluable bleſſing, liberty. It is however ſuppoſed to extend between 28°. and 38°. N. latitude. On the N. it is bounded by very high mountains, and a country utterly unknown, having never been pervaded by *Europeans*. On the E. it has the country of *Louiſiana*; on the W. the gulf of *California*, and the river *Colorado*; while on the S. it is bounded by the province of *Mexico Proper*.

As it lies in the midſt of the temperate zone, it enjoys a very agreeable climate. The ſummers, indeed, are very warm, and the winters ſomewhat ſharp; but then the former are neither ſtifling nor unhealthy, nor the latter intenſely cold, or deluged with floods of heavy rain, but the air is clear and ſalubrious. Thus in each ſeaſon the climate is very deſirable, and extremely well ſuited to an *European* conſtitution.

The country is well watered with rivers and rivulets, though few of theſe are large or navigable. The *Rio Solado* and the *Rio del Norte* alone deſerve notice; the laſt flowing the whole length of the country, and then making a ſweep eaſtward, runs through the province of *New Leon*, and diſcharges itſelf into the gulf of *Mexico*.

There are alſo ſeveral ſmaller rivers that fall into the *Mexican* ſea, and ſome bays, ports, and creeks, on that coaſt, which might eaſily be converted into excellent harbours, had the *Spaniards* any ſhare of that diligence and commercial ſpirit which animates the other maritime powers of *Europe*.

The land is beautifully interſperſed with riſing grounds and fertile plains, covered with trees, ſome of which are fit for timber, and others produce various kinds of fruit.

Here are ſaid to be found *gold* and *ſilver*, *turquoiſes*, *emeralds*, and other precious ſtones. Here are all kinds of wild and tame *cattle*, eſpecially cows, with a prodigious variety of *fowl*; and the rivers are abundantly ſtored with the moſt delicious *fiſh*. In ſhort, it is affirmed to be one of the pleaſanteſt, richeſt, and moſt plentiful countries in *America*, or in any other part of the world.

New Mexico is divided by ſome geographers into fifteen provinces, and by many of the *Spaniſh* writers into eighteen, of which they give us the names.

SANTA FE, the capital, is a handſome well-built town, ſeated near the ſource of the *Rio del Norte*, in 36°. 40'. N. latitude, and in 107°. W. longitude from *London*. It is regularly built, and is the ſee of a biſhop, ſuffragan to that of *Mexico*, and the ſeat of the governor of the country, who enjoys his poſt five years.

The natives are diſintereſted, generous, and pacific, yet extremely formidable on account of the dexterity with which they handle their bows and arrows. They are better provided for their defence than any other inhabitants of the new world. When the *Spaniards* firſt entered the country, they found the natives well cloathed, their lands cultivated, their villages neat, and their towns built of ſtone, in conſtructing which they diſcovered ſome ſkill in architecture, not indeed derived from the rules of art, but the convenience dictated by nature. Their flocks of cattle were numerous, and they appeared to live in a very comfortable manner. We are told, that they were ſo ſkilful in ſhooting, that at a conſiderable diſtance they would diſcharge an arrow ſo true, as to ſhake the grain out of a ripe ear of *Indian* corn without breaking it. They were great lovers of mule's fleſh, and upon that account frequently ſeized the mules of the *Spaniſh* travellers, leaving their cheſts of ſilver upon the road, becauſe they ſet no value upon that metal. They worſhipped the ſun and moon, but diſcovered a greater readineſs to embrace the doctrines of Chriſtianity than any other of the *American* nations; expreſſing no other diſlike to it, but a fear that it would oblige them to part with their freedom, to which they were extremely attached. Their princes were little more than the leaders of their armies, elected at the pleaſure of the people, on account of their wiſdom or valour.

The *Spaniſh* writers ſay, that *New Mexico* is inhabited by a great variety of different nations, entirely unconnected with each other; but the principal are the *Apaches*, the ſeveral tribes of whom are diſtinguiſhed by their towns and ſettlements. They are a brave, warlike, reſolute people, fond of liberty, and the inveterate enemies of tyranny and oppreſſion; of which the *Spaniards* had fatal experience toward the cloſe of the laſt century, when theſe *Indians* took arms and ravaged the country planted by the *Spaniards*. At length they were rather appeaſed than ſubdued, and ever ſince have remained the allies, but not the ſubjects of *Spain*.

CALIFORNIA,

THE moſt northern part of the *Spaniſh* dominions on the continent of *America*, toward the *Pacific* ocean, received the name of *New Albion* from Sir *Francis Drake*, who took poſſeſſion of it in the name of queen *Elizabeth*. It is alſo called by ſome writers *Iſlas Carabiras*. This province was for a long time conſidered as an iſland, but is now found to be a peninſula in the *Pacific* ocean, iſſuing from the N. coaſt of *America*, and extending from 32°. N. latitude, to the S. E. where it is terminated by *Cape St. Lucar*, in 23°. N. latitude, the whole peninſula being near eight hundred miles in length.

It is divided from *Mexico* by a gulf, in which are many iſlands. The peninſula is very unequal in breadth; toward the N. it is near two hundred miles wide, but at the ſouthern extremity it tapers away, and is ſcarcely fifty miles over.

Though it lies for the moſt part in the temperate zone, the coaſt is very hot in ſummer, but the inland part is more temperate. In winter it is very cold, but healthy.

However, in ſo extenſive a country there muſt be great variations, both of ſoil and climate; and *California* has not only ſome of the moſt beautiful lawns, but has many of the moſt inhoſpitable deſerts in the univerſe. The lands to the weſtward of the river *Colorado* are level and fruitful, interſperſed with delightful woods, cool refreſhing ſprings and rivulets, and the moſt enchanting paſtures and meadows. Upon the whole, though this country, on a general view, appears rather rough, craggy, and unpromiſing, yet we are aſſured that, with due culture, it furniſhes every neceſſary of life.

It produces great quantities of timber fit for ſhipbuilding; and among the ſhrubs is one called *pitahaya*, which is ſaid to be peculiar to *California*: its branches are finely fluted, and riſe vertically from the ſtem, ſo as to form a very beautiful top. The ſhrub bears no leaves, the fruit growing on the boughs without ſhade or cover. It reſembles a horſe cheſnut, but contains a pulp, which has ſome reſemblance to that of a fig. In ſome ſhrubs this pulp is white, in others yellow, and ſometimes red, but always exquiſitely delicious, having a rich ſweetneſs tempered with a grateful acid. This peninſula has alſo moſt of the fruits to be found in other parts of *America*; and what is extraordinary, there is here a ſpecies of *manna*, ſuppoſed to fall with the dew, and to become inſpiſſated on the leaves of the trees. Father *Pinolo* ſays, that without the whiteneſs of refined ſugar, it has all the ſweetneſs. Botaniſts are now agreed, that this manna is a juice exſudating from the tree, though the natives firmly believe that it drops down from heaven.

California has likewiſe all ſorts of domeſtic animals that are commonly uſed in *Spain* and *Mexico*. Among the native animals is one called *taye*, which is of the ſize of a young heifer, and greatly reſembles it in its ſhape; but the head is like that of a deer, and the horns, which are thick and curved, reſemble thoſe of a ram. The hoof of this animal is large, round, and cloven; the ſkin ſpotted, but the hair thinner, and the tail ſharper than that of a deer. The fleſh is greatly eſteemed.

With reſpect to the feathered race, beſide the birds produced in other parts of *America*, there are ſaid to be many peculiar to this country; but we have no deſcription of any of theſe, the natural hiſtory of *California* not having been hitherto treated of by any naturaliſt.

Turtle are caught in the utmoſt plenty on the coaſt, and the multitude and variety of fiſh with which the gulf of *California* and the *Pacific* ocean are ſupplied, is almoſt incredible. On the coaſt of the *Pacific* ocean is a ſmall ſhell-fiſh, which is perhaps the moſt beautiful in the world; its luſtre ſurpaſſing that of the fineſt pearl, and darting its rays through a tranſparent varniſh of an elegant vivid blue.

California is inhabited by ſeveral *Indian* nations, who are in general handſome, active, and robuſt; of a healthful countenance, but very ſwarthy: the paint with which they daub themſelves, and the holes which they perforate in their ears and noſtrils, repreſent them to great diſadvantage in the eyes of an *European*, though theſe are deemed a great beauty in their own. The natives have a tradition, that their anceſtors came from the north, which might be reaſonably inferred from their ſituation, *California* being ſurrounded by the ſea, except on the N. where it joins the continent.

Their houſes conſiſt of wretched huts, built near the few ſtreams, wells, or ponds, found in the country. As they are under the neceſſity of frequent migrations in ſearch of food, they eaſily remove their reſidence, it requiring only the labour of a few hours to build a little habitation fitted for all their purpoſes; and it is uſual with them, in the ſeverity of winter, to live in ſubterraneous caverns.

Their dreſs conſiſts of a girdle, with a cloth round their waiſts, and a few ornaments about their hair, as, ſtrings of pearls, which abound on the coaſt, and interweaving their locks with beautiful feathers. Some wear fillets of neat net-work. Their arms are likewiſe frequently adorned with net-work, or ſtrings of pearls, in the form of bracelets. The *Indians* of the N. wear their hair ſhort, and, inſtead of ſtrings of pearl, decorate the head with a ſplendid kind of tiara, made of mother of pearl, detached from the ſhell by a flint, and finely poliſhed on both ſides. Though many of the women go as naked as the men, yet they ſhew great regard to that decency, ſo neceſſary to the ſecurity of virtue. They generally, indeed, wear a kind of petticoat, made of palm leaves; and all carefully conceal thoſe parts which decency teaches them to hide. A love of ornament prevails among the women more than the men.

Their greateſt ingenuity appears in their fiſhing-nets, which are made with admirable ſkill, of various colours, and ſuch diverſity of texture and workmanſhip as cannot be deſcribed. Father *Toraval* ſays he can affirm, that of all the nets he ever ſaw in *Europe* and *Mexico*, none are comparable to theſe, either in the mixture of the colour, or the ſtrength and workmanſhip, in which they repreſent a great variety of figures. The nets are woven by the men, but the women ſpin and prepare the materials from plants, and a coarſe ſort of thread made from the palm. Some of them adorn their heads and necks with theſe nets; they are likewiſe uſed for holding fruit, and the vegetable productions of the earth, as well as for catching fiſh.

The *Jeſuits*, who have given a deſcription of this country, have introduced ſo many abſurd and ridiculous circumſtances, that it is, perhaps, impoſſible to diſtinguiſh truth from fiction, in the account they give of the religion and cuſtoms of theſe people.

This extenſive country can ſcarcely be ſaid to be ſubject to *Spain*. The *Jeſuit* miſſionaries have indeed endeavoured to propagate the *Romiſh* religion, and a number of them have ſettled in the country; but at preſent a little *Spaniſh* town, near the *Cape* of *St. Lucar*, is the only place that can be ſtrictly called ſubject to *Spain*; and that is made no other uſe of than as a place of refreſhment for the *Manilla* ſhip, and its being the principal reſidence of the miſſionaries.

In digging into a hill in *California*, not many years ago, ſeveral gigantic ſkeletons were found. Bones, ſkulls, and entire ſkeletons of a prodigious ſize, have likewiſe been dug up, at different times, in many parts of *New Spain*; from whence many authors have, with great appearance of reaſon, inferred, that the country was, at ſome remote but unaſſignable period, peopled by a race of giants, and the traditional belief of the natives ſerves to ſtrengthen this opinion. At the ſame time it is remarkable, that no ſkeleton, bone, or part of any large animal, ſuch as an elephant or an hippopotamus, has ever been found; ſo that there is every reaſon to ſuppoſe that ſuch creatures never had exiſtence in the new world. *Hernandez* and *D'Acoſta*.

MEXICO, *or* NEW SPAIN.

THIS country, the firſt valuable acquiſition of the *Spaniards* on the continent of *America*, extends from 7° 20′ to 32° N. latitude, and from 59° 40′ to 84° 50′ W. longitude from *Greenwich*; it is bounded on the S. E. by the iſthmus of *Darien*, and on the N. W. by *New Mexico*; being waſhed by the gulf of *Mexico* on the E. and on the S. and W. by the *Pacific* ocean, or South ſea. This country ſtretches along the *Pacific* ocean above two thouſand miles, and the coaſt toward the *Atlantic* ocean cannot extend leſs than ſixteen hundred; but the breadth is very unequal, for to the N. W. it is ſuppoſed to be between ſix and ſeven hundred miles over, while toward the S. E. the breadth cannot much exceed ſixty miles. A part of this country, called "the Vale of *Mexico*," was anciently named *Anahuac*, which was afterward uſed to denominate almoſt all that tract of land, which is known at preſent by the name of *New Spain*. *Clavigero's Hiſtory of Mexico, tranſlated by Cullen*, I. 1.

As the greateſt part of *Mexico* lies within the Torrid Zone, the air is exceſſively hot, but the heat is qualified with refreſhing ſhowers in the hotteſt months, and with land and ſea-breezes, which blow alternately; in ſome parts the vapours riſing from a great number of lakes and rivers cool the air, and render it mild, ſoft, and pleaſant. The greateſt heats are during the months of February, March, and April, when the ſun is ſeldom obſcured by clouds, and the waters are ſo dried up, that in many places it is difficult to procure that element. The rainy ſeaſon begins toward the cloſe of April, and continues till the month of September, and is always preceded by tempeſts of thunder and lightning; which increaſe till the month of June, at which time the rains fall as if a ſecond deluge was pouring down.

On the eaſtern coaſt, where the land is low, marſhy, and conſtantly flooded in the rainy ſeaſon, it is extremely unhealthy; the coaſt is far from being pleaſant, it being for the moſt part encumbered with almoſt impenetrable woods of mango trees, of a bare and diſagreeable aſpect, and which extend a conſiderable way into the water. The inland country, indeed, aſſumes a more agreeable aſpect, and the air is more temperate: here the tropical fruits grow in great abundance; the land is agreeably variegated, and the ſoil extremely fertile. On the weſtern ſide the land is not ſo low as on the eaſtern, is much better in quality, and abounds with plantations.

The *Spaniards* probably choſe to leave the eaſtern coaſt in its preſent ſtate of rudeneſs and deſolation, judging that a rugged and unwholeſome frontier is a better defence againſt an *European* army, than fortifications and armies that are maintained at a vaſt expence; or than the ſtrength of the inhabitants, whom the climate renders effeminate and puſillanimous, and whoſe ſpirits are ſubdued by oppreſſion. It may be ſaid in general, that few countries under the ſame aſpect of the heavens enjoy more of the benefits of nature, and the neceſſaries of life; but, like all the tropical countries, it is more abundant in fruit than in corn.

The mountains of this country abound with ores of every kind of metal, and a vaſt variety of other foſſils. Since the conqueſt, ſo many ſilver mines have been diſcovered, eſpecially in the provinces N. W. of the city of *Mexico*, as to be innumerable. The *Mexicans* gather gold chiefly in grains, among the ſands of the rivers. Of *copper* there are two ſorts; one hard, which the natives were accuſtomed to uſe inſtead of iron, to form into axes, hatchets, mattocks, and other implements of war and agriculture; the other ſort of copper is flexible, and with this they make baſons, pots, and other veſſels. The country was not deſtitute of iron mines; but the natives either had not found them, or knew not how to convert them to uſe. There were mines of *tin*, *lead*, *quickſilver*, *ſulphur*, *allum*, *vitriol*, and a *white earth*, reſembling white lead. *Clavigero*, I. 15.

Mexico has alſo quarries of *jaſper*, *porphyry*, and beautiful *marble*; and here are alſo found *pearls*, *emeralds*, and *turquoiſes* *.

However rich and abundantly various the mineral kingdom of *Mexico* is, yet the vegetable is ſtill more diverſified. Dr. *Hernandez* (the *Pliny* of *New Spain*) deſcribes, in his Natural Hiſtory, about twelve hundred plants, natives of that country. Of grain, that moſt cultivated, and generally conſumed, is *maize*, which the *Mexicans* call *Tluolli*: of this there are ſeveral kinds differing in ſize, colour, weight, and taſte.

The woods on the tops and declivities of mountains conſiſt either of fine foreſts, or delightful groves of large trees of various kinds, unencumbered with bruſh wood; ſo that a traveller may paſs through them on horſeback without any inconvenience. Among the moſt curious ſpecies of woods in this country are the *cedar*, *bloodwood*, *maho*, of which the natives make ropes and cables, *lightwood*, and other trees; of the fruit-trees and ſhrubs are the *cabbage*, *cacao*, or *chocolate-nut*, the *venilla*, *plantains*, *capadillo*, *avogato-pear*, *mammee*, *mammee-ſapota*, the *prickly pear*, *bibby*, *tamarind*, and *locuſt-tree*; the *calabaſh*, *gourds* of a prodigious ſize, *grapes*, and many others. To theſe may be added the grenadillo or *China* creeping plant, and the *mayhey*, which furniſhes the natives with thread for linen and cordage, and alſo with a balſam and liquor, which, when fermented, is as pleaſant and ſtrong as wine.

Trees are all the year in leaf, bloſſom, or fruit; and every month preſents the mingled appearance of ſpring, ſummer, and autumn. They grow to an incredible bulk and height in this country. *Acoſta* makes mention of a cedar, the circumference of whoſe trunk was ſixteen fathom. The *Abbé Clavigero* ſays he has ſeen in a houſe there, a beam, one hundred and twenty *Caſtillian* feet long. In *Mexico* and other cities there are very large tables of cedar to be ſeen, conſiſting of one ſingle board. In the valley of *Atlixo* there is ſtill growing a very aged fir tree, of ſuch vaſt dimenſions, that fourteen men on horſeback have at the ſame time been aſſembled in a cavity of its trunk which lightning produced, and this wonderful fact is confirmed by the reſpectable teſtimony of *D. F. Lorenzana*, formerly archbiſhop of *Mexico*, now of *Toledo*, who, in his annotations on the letters of *Cortez* to *Charles* V. which were printed in *Mexico*, in the year 1770, aſſerts, that he himſelf, accompanied by the archbiſhop of *Guatemala*, and the biſhop of *Angeloſi*, went to view this celebrated tree, and that he made an hundred boys enter its trunk.

Beſide *maize*, or *Indian* corn, the native grain of *Mexico*, the *Spaniards* have cultivated wheat, barley, peas, beans, and other corn, which, with roots and vegetables, are now found growing in every province. Rice grows abundantly, and is cultivated with great advantage, from the long rainy ſeaſons which prevail.

Among the valuable commodities of *New Spain* are the following drugs; *copal*, *anime*, *tacahacha*, *caranna*, liquid *amber*, oil of *amber*, *balſam* of *Peru*, which is found in *Mexico*, as well as in that country from which it takes its name, *guaiacum*, the root *mechoacan*, *China* root, and *ſarſaparilla*; all which are known in the ſhops of our apothecaries, and are of great uſe in a variety of diſtempers. The other commodities of *New Spain* are cotton, ſugar, cochineal, chocolate, feathers, honey, balſams, dying woods, ſalt, tallow, hides, tobacco, ginger, amber, pearls, precious ſtones, gold and ſilver.

A conſiderable quantity of ſugar is raiſed in this country, ſo that there are more ſugar-mills than in any part of *Spaniſh America*; but all the ſugar is uſed in the country, and particularly in the monaſteries, in chocolate, ſweetmeats, preſerves, and confectionary wares. There is alſo a great home-trade in goods manufactured of cotton. They have the beſt indigo in the world, and the trade in that and cochineal is managed entirely by the merchants of *Mexico* and *Carthagena*, who export them to *Europe*. In the province of *Guaxaca* and *Guatimala*, they procure the greateſt quantity of ſilk, and of the beſt quality of any country in *New Spain*; but it is only prepared for the needle. Cotton here is very good, and in great plenty; it is manufactured largely, for as it is light wear, ſuitable to the climate, and all other clothing extravagantly dear, it is generally worn by the common people; the woollens and linens of *Europe* being rather luxuries worn only by perſons of fortune.

The quadrupeds which were common to *Mexico* and the *American* continent, as well as to the old world, are, *lions*, *tygers*, *wild cats*, *bears*, *wolves*, *foxes*, the common *ſtag*, and white *ſtags*, *bucks*, wild *goats*, *badgers*, *polecats*, *weazels*, *martens*, *ſquirrels*, *rabbits*, *hares*, *otters*, and *rats*. *Buffon* denies the lion, tyger, or rabbit, to be native of *America*; but this opinion is not generally admitted by naturaliſts.

The number of their horned cattle is very great; many of them run wild, and a very conſiderable trade is carried on in their hides and tallow. Sheep are numerous in *Mexico*, but it does not appear that wool is an article of any conſideration in their trade; and it is not probable that it is of a good kind, as it is ſcarcely ever found uſeful between the tropics, where it is coarſe, ſhort, and hairy, except only in *Peru*, which enjoys a climate different from that of all other countries. Swine are equally numerous, and their lard is much in requeſt all over the country, where it is uſed inſtead of butter.

The *pecaree* is a little black ſhort-legged animal, that has ſome reſemblance to a hog. Theſe herd together in great numbers; and, what is moſt remarkable, the navel is ſaid to grow upon its back; and if it be not cut off as ſoon as the pecaree is killed, it inſtantly corrupts the whole carcaſe, which is otherwiſe very good food.

The *ſloth* is about the ſize of a large ſpaniel, has a round head, ſmall eyes, and very ſharp teeth and claws: he feeds on the leaves of trees, and frequently kills them, not leaving a ſingle leaf on the tree he viſits; but he is ſo many days in deſcending one tree, and climbing another, that though he be fat when he comes down, he grows lean before he can get to the top of the next tree. He receives his name from the ſlowneſs of his motions, for he is ſaid to be ſeveral minutes in moving one of his legs three inches, nor will blows make him mend his pace, for he ſeems inſenſible of ſtripes, and can neither be frightened nor provoked.

The monkies of *Campeachy* are very ugly; they are much larger than a hare, and have tails two feet and a half long; the body and upper part of the tail are covered with a coarſe, long, black hair. They keep together in herds of twenty or thirty, traverſing the woods, leaping from tree to tree, and if they meet with a ſingle perſon unarmed, he is in danger of being torn to pieces by them; at leaſt they chatter and make a terrible noiſe; ſome pelt him, while others ſcatter their water and dung upon him: they ſuſpend themſelves by the tail on the boughs, and ſeem to menace him all the way he paſſes; but when two or three perſons are together, the monkies generally ſcamper away.

---

* *Clavigero* ſays there are entire mountains of *loadſtone*. I. 16.

With reſpect to the feathered race, in *Mexico* are found tame *poultry*, *turkies*, *pigeons*, *parrots*, *parakeets*, *macaws*, *quams*, *curaſoes*, *cockricoes*, *bill-birds*, *humming birds*, *black birds*, *eagles*, *vultures*, *pelicans*, *cormorants*, *bats*, and a multitude of others*. Here is a ſpecies of bird larger than the raven, called the *Zopilote*, with a hooked bill and crooked claws, and on the head, inſtead of feathers, is a wrinkled membrane with ſome curling hairs. They fly ſo high that, notwithſtanding their ſize, they are loſt to the ſight: before a ſtorm they may be ſeen wheeling, in vaſt numbers, under the thickeſt and higheſt clouds, until they entirely diſappear. Theſe birds prey upon carrion, which they diſcover from the greateſt height by the acuteneſs of their ſight and ſmell, and deſcend with a majeſtic flight, in a ſweeping ſpiral courſe: they are almoſt mute.

The birds diſtinguiſhed for their beautiful plumage conſiſt of a vaſt variety of ſpecies: the *Abbé Clavigero* has diſtinguiſhed thirty-five, all of which, he ſays, are uncommonly beautiful.

Here are a great number of poiſonous and troubleſome reptiles and inſects, as *ſnakes*, *ſcorpions*, *centipedes*, *ſpiders*, *toads*, *ants*, and *muſkettoes*.

The *Mexican crocodile* reſembles that of *Africa* in ſize, form, voracity, habits of life, and every other characteriſtic. This deſtructive animal abounds in many of the lakes and rivers. Here are alſo many lizards of different ſpecies; a *cameleon* with large round open ears. Among the other lizards of the harmleſs kind the moſt remarkable is the *Tapayaxin*, which is perfectly round, cartilaginous, and feels very cold to the touch: the diameter of its body is ſix inches. Its head is very hard, and ſpotted with various colours. It is ſo ſluggiſh that it does not move even when ſhaken. It is an inoffenſive animal, and ſeems to take pleaſure in being handled; probably its natural coldneſs cauſes it to derive an agreeable ſenſation from the heat of a hand.

Among the various kinds of ſerpents is a *yellow ſnake*, as large as the ſmall of a man's leg, and ſix or ſeven feet long. This is a lazy animal, that takes little pains to hunt for its prey, but lies concealed, and ſurpriſes the lizards, guanoes, and other ſmall animals, as they paſs by. There is alſo a *green ſnake*, about the thickneſs of a ſmall cane, and four or five feet in length: theſe lie among buſhes and trees, concealed under leaves, and prey chiefly on ſmall birds. Here is alſo a *dun-coloured ſnake* about two feet long, that frequents houſes, and kills mice and other vermin, and is ſo harmleſs that no one endeavours to kill it. There are many other ſnakes, and particularly the *rattle-ſnake*, of which we have already given a very particular account, page 680 of this volume.

The locuſt is an inſect that brings deſtruction whereever it comes, and is moſt found in hot countries, where they ſometimes appear in ſuch clouds as to hide the ſun, and darken the brighteſt day. They are much like the graſshopper, but larger, and have wings. While Mr. *Gage* (the maternal great grandfather to the author of his work) was in *Mexico*, a cloud of theſe inſects viſited that part of the country where he reſided, lighting upon the trees and ſtanding corn, and in one night devoured both the fruit and leaves of the trees, and conſumed the corn in every field where they fell. The highways were covered with them, and neither the plantations of ſugar or indigo eſcaped. Upon the approach of this winged army, all people were commanded out into the fields, with trumpets, braſs-pans, kettles, and every thing that would make a noiſe, to frighten them away. The Abbé *Clavigero* was alſo witneſs to a like viſitation upon the coaſts of *Xicayan*; but he ſays no part of this continent has experienced this dreadful calamity ſo frequently as *California*, I. 70.

Of the worms common here, ſome are uſeful and others pernicious; ſome were uſed by the ancient *Mexicans* for food, and others medicinally. The *Tleocuilin*, or burning worm, has the ſame quality as the cantharides: its head is red, the breaſt green, and the reſt of the body of a tawney colour. The *Temahuani* is a worm covered with yellow venomous prickles. The *Temictli* reſembles the ſilk-worm, both in its metamorphoſes and in its operations. The *ſilk-worm* was brought from *Europe*, and was propagated with ſucceſs. Much ſilk was made of a good quality, eſpecially at *Mizteca*, where it became a conſiderable article of trade, and ſome places there ſtill preſerve the name which they formerly received upon account of that trade, as, *Silk St. Francis*, *Silk Tepexe*; but the *Miztecans* being afterward, from political cauſes, forced to abandon it, the rearing of the worms was likewiſe neglected, and at this time very few perſons are employed in that buſineſs. *Clavigero* ſpeaks of another kind of ſilk, very white, ſoft, ſtrong, and of an excellent quality, which is often to be found upon trees, in many of the woods upon the ſea coaſts, particularly in thoſe years when there has been little rain; but this ſilk is not converted to any uſe, unleſs by ſome poor people, from the impediments which are thrown in the way of converting it into an article of trade. I. 71.—It appears from *Cortez'* Letters to *Charles* V. that ſilk uſed to be ſold in the markets of *Mexico*; and ſome pictures by the ancient *Mexicans* are ſtill preſerved, which are done upon a paper made of ſilk.

The moſt common *ants* of this country are of three ſpecies: the ſmall black ant like thoſe of *Europe*; the large red ant, called by the *Spaniards brava*, or fierce, theſe give very painful wounds with their ſtings; the third kind is the large brown ant, called by the *Spaniards harriera*, or carrier, from this creature being continually employed in carrying grain, on which account this is the moſt hurtful ſpecies to the country. There is another very ſingular ſpecies of ant, found in *Michuacan*, which is larger than the common ant, with a greyiſh-coloured body and black head. Upon its hinder parts it carries a little bag, which contains a very ſweet liquor. *M. de Barrere*, in his Natural Hiſtory of *Equinoctial France*, takes notice of ſuch ants being found in *Cayenne*, but thoſe are winged ants, and they of *Mexico* are without wings.

The *cochineal* of *Mexico*, ſo well known and ſo highly eſteemed all over the world for the beauty of the colour which it produces, is an inſect peculiar to this country. Particular attention was always paid to the rearing it in the time of the *Mexican* kings, but the country where it thrives beſt is that of *Mizteca*, where it is the principal branch of commerce. The *cochineal*, at its utmoſt growth, in ſize and figure reſembles a bug. The female is ill-proportioned and ſluggiſh. The eyes, mouth, antenna and feet, are ſo concealed among the wrinkles of its ſkin, that they cannot be diſcovered without the aſſiſtance of a microſcope, from whence an opinion has prevailed that the cochineal is a kind of ſeed and not an inſect, but that great naturaliſt, *Hernandez*, has fully deſcribed it. The males are much leſs numerous than the females, one of the former ſerving three hundred of the latter for every purpoſe of propagating the ſpecies. The male is ſmaller and thinner than the female, but more lively and active. Upon the head of this inſect are two articulated antennæ, in each articulation of which are four ſmall briſtles regularly diſpoſed. It has ſix feet, each conſiſting of three parts. From the hinder part of the body two hairs grow out, which are twice or thrice as long as the body of the inſect. The male has two large wings, with which the female is not provided: theſe wings are ſtrengthened by two muſcles, one external, extending along the circumference of the wing, the other internal, which runs parallel to the former. The internal colour of this inſect is a deep red, but darker in the female than in the male; the external colour is a pale red. In the wild inſect the internal colour is ſtill darker, and the external whitiſh or aſh-coloured. As the mulberry tree is the proper food for the ſilk worm, ſo a ſpecies of *Noſal*, or *Indian* fig, nouriſhes the cochineal. This tree grows to the height of about eight feet, and bears a fruit which is not eatable. The inſect feeds upon the leaves of this tree, ſucking the juice by means of a trunk placed in the thorax, between the two fore feet. Upon theſe leaves it paſſes through all the ſtages of its growth, and at length produces a numerous offspring.

---

* According to *Abbé Clavigero* there are more than ſeventy ſpecies of birds which afford wholeſome and palatable food. I. 50.

On the coaſts and on the banks of rivers are caught ſeveral ſorts of *turtle*, alſo *oyſters* and *muſſels* of a prodigious ſize, *lobſters*, *crabs*, and *ſhrimps*. Among the other fiſh are the *paracoad*, which is about three feet and a half in length, and, it is ſaid, will attack a man in the water. It is a firm well-taſted fiſh, but ſome of them have been found to be unwholeſome food. In both ſeas are *whales* and *dolphins*.

The *gar-fiſh* reſembles the former, but is leſs, and has a long ſharp bone in its ſnout, like a ſword-fiſh; only the ſword-fiſh's bone is flat, and indented like a ſaw, while that of the gar-fiſh reſembles a ſpear, it being round, ſmooth, ſharp at the end, and about a foot long. Theſe fiſh ſwim very ſwiftly, frequently leaping out of the water, and ſkimming, as it were, juſt above the ſurface, for twenty or thirty yards; then wetting their fins, ſpring forward again, darting themſelves with ſuch force, that they will ſtrike their long ſpear through the ſides of a canoe, or the body of a man. This fiſh is eſteemed well-taſted and wholeſome food.

Mullets and *ſnooks* are very plentiful; as are alſo *Spaniſh mackarel*, which reſemble thoſe of *Europe*, but are above a yard in length, and nine or ten inches round. Here are alſo the *old-wife*, the *cavally*, the *turpom*, and ſeveral other kinds of fiſh. In the lakes and rivers are *pike* and *carp*, with plenty of others that are excellent food.

Among the *inſects* of *Mexico*, of which there are an innumerable multitude, the *cucujo*, or *ſhining beetle*, is moſt deſerving notice. It is more than an inch in length, and, like other flying beetles, is furniſhed with double wings. Upon the head is a ſmall moveable horn, of great uſe to the creature when accidentally thrown upon its back, for by thruſting this horn into a membrane ſomewhat like a bag, on the belly, it is enabled to recover its natural poſition. Near the eyes are alſo two ſmall membranes, and upon the belly another ſomewhat larger, of a thin, tranſparent ſubſtance, all which are full of luminous matter, affording a light ſtrong enough to read by, and to point out the road to ſuch as travel by night. It ſhews moſt light when it flies, but none while it ſleeps, being then covered with the upper opaque wings. The luminous parts are compoſed of a white, mealy, viſcid ſubſtance, which preſerves its luminous quality after it has been taken from the body of the cucujo, and ſhining characters may be drawn with it upon a hat. Theſe flying phoſphori are found in great numbers upon the ſea-coaſts, and form, upon the neighbouring hills, at night, a very beautiful and brilliant ſpectacle. Some authors have confounded this wonderful inſect with the glow-worm, although the latter is much ſmaller, and much leſs luminous; but this likewiſe is extremely common in *Mexico*. *Clavigero*, I. 67.—— Here are at leaſt ſix different kinds of *bees*, four of *waſps*, and a black hornet with a red tail, whoſe ſting is ſo large and ſtrong, as not only to pierce through a ſugar cane, but even into the trunk of a tree.

The *butterflies* of *Mexico* are much more numerous, and of greater variety than in *Europe*. *Hernandez* has made drawings of ſome, but the fineſt pencil is unable to imitate the exquiſite colouring and deſign which the Author of nature has diſplayed in the embelliſhment of their wings.

The three Audiences of Mexico. *The Cities of* Guadalajara, Mexico, Acapulco, Los Angelos, La Vera Cruz, *and* Guatimala.

IN order to give a more diſtinct idea of this extenſive country, it will be neceſſary to deſcribe it under its three grand diviſions, called audiences, *Guadalajara*, *Mexico Proper*, and *Guatimala*, all which are under the government of the ſame viceroy, and are ſubdivided into ſeveral provinces.

Guadalajara, alſo called Galicia, is bounded on the N. by *New Mexico*; on the E. and S. by the audience of *Mexico*; and on the W. it is waſhed by the *South Sea* and the *Gulf of California*; containing a ſpace of eight hundred miles in length, and above five hundred in breadth. It is divided into ſeven provinces, and being the moſt temperate diviſion of the empire, is generally pleaſant and healthy. Theſe provinces are *Guadalajara Proper*, *Zacatecas*, *New Biſcay*, *Cinaloa*, *Culiacan*, *Chametlan*, and *Xaliſco*.

The capital, called *Guadalajara*, is the ſeat of the royal courts of judicature; it is a biſhop's ſee, and is pleaſantly ſeated on the N. banks of the river *Bareinja*. It has ſeveral churches, beſide the cathedral, with ſome monaſteries and nunneries. This audience is celebrated for the richneſs of its ſilver mines and for its fertility. In each of the provinces are ſeveral towns; and that of *Cinaloa* is rendered extremely pictureſque by a number of beautiful caſcades falling in ſtreams down the mountains. In this audience is the lake of *Chapala*, which is ſaid to be forty leagues in compaſs.

The audience of Mexico is beyond compariſon the moſt valuable of the *Spaniſh* dominions N. of the equator. On the E. it is bounded by the *Gulf of Mexico*, on the S. E. by the audience of *Guatimala*, on the S. W. by the *South Sea*, and on the N. W. by the audience of *Guadalajara*. It extends about ſix hundred miles in length, and in ſome places near as much in breadth; yet it is only about ſixty leagues in breadth from ſea to ſea, acroſs the province of *Guaxaca*.

The great lakes, rivers, and ſea-ports, with which this audience abounds, not only furniſh the inhabitants with plenty of excellent fiſh, but give them great advantages in trade, both foreign and domeſtic. It is divided into nine provinces, namely, *Mexico Proper*, *Mechoacan*, *Panuco*, *Tlaſcala*, *Guaxaca*, *Tabaſco*, *Jucatan*, *Chiapa*, and *Soconuſco*.

The province of Mexico Proper, which greatly exceeds the reſt, contains the capital of the ſame name, and is ſeated in the lake of *Tuſcuco* or *Mexico*, on the E. ſide of a valley, at the foot of a range of hills, in 19° 26′ N. latitude, and 101° 12′ W. longitude from *Greenwich*, about a hundred and ſeventy miles W. of the *Gulf of Mexico*, and a hundred and ninety N. of *Acapulco*. *Clavigero* calls it "the moſt renowned of all the cities of the new world," and ſays it is, like *Venice*, built on ſeveral iſlands.

The lake *Tuſcuco*, he ſays, extended fifteen or ſeventeen miles from E. to W. and ſomething more from N. to S. but its preſent extent is much leſs, the *Spaniards* having diverted into new channels many of the rivers which formerly ran into it. The ſame writer ſays, that all the water which aſſembles there is at firſt ſweet, and becomes afterward ſalt from the nitrous quality of the bed of the lake. *Hiſt. of Mexico*, I. 4.

Mexico is the capital of the kingdom, the reſidence of the viceroy, the ſeat of the firſt audience or chamber of juſtice, and the ſee of an archbiſhop. This is thought to be the moſt regular built city in the world. It is a perfect ſquare, each ſide extending half a league, and conſequently the whole is about two leagues, or ſix miles in circumference. There is a great ſquare in the centre, from whence the ſtreets run in direct lines, either N. and S. or E. and W. croſſing each other at right angles; ſo that the length and breadth of the city may be diſcerned at the corner of every ſtreet. It has neither gates, walls, nor artillery. The houſes are built very ſtrong of brick and ſtone, but not very high, on account of its being ſubject to earthquakes; and great part of the town ſtanding upon a moraſs, this has occaſioned the foundations of ſome of them to ſink; but what is ſtill worſe, it is ſubject to inundations from the ſtreams which flow down from the mountains into the lake, ſo that it is in frequent danger of being overflowed; and indeed many of the houſes and inhabitants have been actually ſwept away by floods, though they have been at a vaſt expence in making canals, dykes, and ſluices to carry off the water; ſo that it has often been debated, whether the city ſhould not be abandoned, and another built upon a more favourable ſpot. All the buildings are convenient, and the public edifices magnificent. Here are twenty-nine cathedrals and churches, and twenty-two monaſteries and nunneries. The cathedral is a magnificent pile, built in the form of a croſs, which, with the cloiſters and dwellings of the clergy adjoining to it, take up a large ſpace of ground in this city, and was ſixty years in building, at the expence of about two millions of pieces of eight. The paintings, gilding, and carving, are extremely fine, and it contains abundance of beautiful altars and chapels on each ſide; the high altar, which ſtands in the middle of the choir, coſt fifty thouſand pieces of eight. The image of the *Virgin Mary* is of maſſy ſilver, adorned with rubies and pearls to the value of thirty thouſand pieces of eight, and is once a year carried in proceſſion, when a certain number of virgins draw lots for a diſtribution of three hundred pieces of eight for marriage portions to ſuch as prove ſucceſsful. The chalice for the ordinary ſervice is worth eleven thouſand, being of gold, chaſed, and ſet with rubies. The hoſt is here carried to the ſick perſons not on foot, as in other countries, but in a coach drawn by four of the fineſt mules that can be procured from *Europe*.

The great ſquare, or market, in the middle of the city, is extremely magnificent, and has piazzas on one ſide, under which are ſome of the richeſt ſhops in the world; and on another ſide ſtands the magnificent palace of the viceroy, the principal front of which faces the ſquare, and is not inferior to the palace at *Naples*.

The palace of the marquis *de Valle*, as it is called, is one of the nobleſt pieces of architecture any where to be met with. It is built on the very ſpot where formerly ſtood the palace of *Montezuma*, and takes up nearly the ſame ſpace.

The ſeveral trades have their reſpective ſtreets: a very ſpacious one, that runs from the ſquare, belongs to the goldſmiths, and has the ſhops furniſhed with ſuch a variety of utenſils and ornaments of gold, ſilver, and jewels, as is not to be paralleled in any city in the world. The ſtreet of *St. Auſtin*, where the mercers expoſe their rich ſilks to ſale, has a very grand and beautiful appearance. The ſtreet called *Tacuba*, where the tradeſmen who deal in braſs, ſteel, and iron, reſide, is very long and ſpacious: but *Eagle-ſtreet*, which is inhabited by the nobility, gentry, and great lawyers, is ſaid to excel all the reſt in magnificence.

The city is ſupplied with freſh water from a hill at three miles diſtance, to which an aqueduct ſupported on arches extends from the city.

There is a pleaſant park well planted and adorned with fountains, and other water-work, whither the quality of both ſexes and the gay part of the town reſort every evening, ſome in coaches and others on horſeback; and here the young cavaliers endeavour to recommend themſelves to the ladies, by feats of activity and horſemanſhip. Several hundred of coaches are frequently ſeen here, with numerous retinues of black ſlaves.

The city of *Mexico*, though not a ſea-port, and having no communication with the ſea by any navigable river, yet has a prodigious commerce, and is itſelf the centre of all the trade carried on between *America* and *Spain* on the one hand, and between *America* and the *Eaſt Indies* on the other, for here the principal merchants reſide; here the greateſt part of their buſineſs is negociated, and the goods that paſs from *Acapulco* to *La Vera Cruz*, or from *La Vera Cruz* to *Acapulco*, for the *Philippines*, and in a great meaſure for the uſe of *Peru* and *Lima*, all have a paſſage, and employ an incredible number of horſes and mules in conveying. Hither all the gold and ſilver comes to be coined; here the king's fifth is depoſited; and here is wrought all that immenſe quantity of utenſils and ornaments in plate, which is every year conveyed to *Europe*.

One of the principal diverſions of the citizens is fiſhing in boats upon the lake, whither they carry wine and cold proviſions with which to regale themſelves upon the water.

The population of this city is very conſiderable, and has been computed at ſeventy or eighty thouſand. The bulk of the people are blacks and mulattoes, there having been abundance of black ſlaves brought hither, who have obtained their freedom and married with the natives, and their deſcendants are very numerous. There is alſo a ſtrange mixture of *Spaniſh* and *Indian* blood. The pure *Spaniards*, and thoſe deſcended from *Spaniſh* anceſtors on both ſides, are a very ſmall number, both here and in the other towns of *Mexico*.

The Abbé *Clavigero* ſays that he has been upon a mountain not more than twenty-five miles diſtant from the capital, on the ſummit of which he has ſeen white froſt and ice even in the dog days.

There are five mountains in the kingdom of *Mexico*, which have at different times diſcharged volcanic matter: one, called by the *Spaniards Volcan d'Orizaba*, and by *Clavigero Pojauhtecatl*, began to ſend forth ſmoke in the year 1545, and continued its emiſſions for twenty years, when it ceaſed, and has not ſince renewed them. This mountain riſes the higheſt of any in *Mexico*; *Thomas Gage* ſays it is as high as the higheſt *Alps*. It is ninety miles E. of the city of *Mexico*, its top is always covered with ſnow, and its ſides adorned with large cedar, pine, and other trees of valuable wood, which render its appearance very beautiful.

The *Popocatepec* and *Iztaccibuati*, called by the *Spaniards Sierra Nevada*, which are not far diſtant from each other, and within thirty-three miles of *Mexico*, to the S. E. are very high mountains. The former, during the time of the *Mexican* kings emitted flames. It is ſaid by *Clavigero* to have a crater more than half a mile wide. In the laſt century, great quantities of aſhes were diſcharged from it, which overſpread the neighbouring country, ſince which its irruptions have entirely ceaſed. *Iztaccibuati* likewiſe has at times been volcanic. Both theſe mountains have their tops covered with perpetual ſnow, in ſuch quantities as to ſupply the city of *Mexico* and the adjacent country, for forty miles round with that article in great abundance for the tables of the wealthy. The impoſt or duty upon ice conſumed in the city of *Mexico* is ſaid to amount to 20,000 *Mexican* crowns a year, if not now advanced to more than that ſum.

The port neareſt to this city is ACAPULCO, which is alſo in the province of *Mexico Proper*, and is ſituated on the weſtern coaſt, toward the *South Sea*, in 17°. N. latitude, and 102°. W. longitude, upward of 200 miles diſtant from the capital. It has one of the deepeſt, ſecureſt, and moſt commodious harbours in the *South Sea*, and indeed almoſt the only good one upon the weſtern coaſt of *New Spain*. Its entrance is defended by a caſtle of tolerable ſtrength; but the town itſelf is ill built, and makes but a miſerable figure except at the time of the fair, when it entirely changes its appearance, and becomes one of the moſt conſiderable marts in the world. About the month of December the great galeon, which makes the whole communication between *America* and the *Philippines*, after a voyage of five months, arrives here, freighted with all the rich commodities of the eaſt; nutmegs, mace, cloves, pepper, cinnamon, china, *Japan* wares, callicoes plain and painted, chintz, ſilks, muſlins of all ſorts, precious ſtones, and rich drugs. At the ſame time the annual ſhip from *Lima* arrives, and is computed to bring not leſs than two millions of pieces of eight in ſilver, beſide quickſilver, cacao, drugs, and other valuable commodities, to be laid out in the purchaſe of *Eaſt India* goods. Several other ſhips from different parts of *Chili* and *Peru* meet for the ſame purpoſe, at the ſame time; and, beſide the traffic for the commodities of the *Philippines*, they cauſe very large dealings for every thing thoſe countries have to exchange with one another, as well as for the purchaſe of all ſorts of European goods. The fair ſometimes continues for thirty days. The goods are no ſooner diſpoſed of, than the galleon prepares to ſet out on her voyage to the *Philippines*, with her returns, chiefly in ſilver, but with ſome *European* goods and *American* commodities.

When this fair is over the town is comparatively deſerted; however, it remains during the whole year the moſt conſiderable port in *Mexico*, from whence what exceeds their own conſumption is ſent by land-carriage to *La Vera Cruz*, to paſs over the *Terra Firma* to the iſlands, and a ſmall quantity is ſent to *Spain*.

In the province of *Tlaſcala* is the city of LA VERA CRUZ, which is ſeated in the *Gulf of Mexico*, in 19°. 10′. N. latitude, about two hundred miles S. E. of *Mexico*. It is ſituated in a barren ſandy plain, but is conſiderable on account of its excellent harbour, which is naturally defended by rocks: but on one ſide of the town is expoſed to clouds of dry ſand, and on the other to the putrid exhalations of bogs and marſhes, which impregnate the air with the moſt pernicious vapours. The town extends from E. to W. but is not more than half a league in circumference. The walls are of little uſe, the ſands being in many places level with their tops: but the caſtle and forts are ſo ſituated, as to be a defence to the ſhips in the harbour. The town is very poor, moſt of the houſes being no better than thatched cottages, inhabited by fiſhermen; but the *Spaniſh* garriſon conſiſts of a troop of ſixty horſe, and two companies of foot. From this port the wealth of *Mexico* is poured out upon the *Old World*, and here are received the numberleſs luxuries and neceſſaries that the *Old World* yields in return. The annual fleet from *Cadiz*, called the flota, arrives about the latter end of November, and then vaſt multitudes reſort to *La Vera Cruz* from all parts, living in little huts or tents while the fleet remains in the harbour, their valuable merchandize being depoſited in warehouſes built for that purpoſe. The fleet ſtays there during the winter, and upon its departure all the people of ſubſtance retire to a more ſalubrious ſpot.

This fleet, which ſails only from *Cadiz*, conſiſts of about fourteen or fifteen large merchant ſhips from four hundred to a thouſand tons burden, under the convoy of three or four men of war. They are laden with almoſt every ſort of goods which *Europe* produces for exportation; all ſorts of linens, woollens, ſilks, velvets, laces, cutlery, glaſs, watches, clocks, quickſilver, wrought iron, horſe-furniture, ſhoes, ſtockings, books, pictures, military ſtores, wine, and fruit; ſo that all the trading parts of *Europe* are highly intereſted in the cargo of the fleet. *Spain* ſends out little more than the wine and fruit, and this, with the freight and commiſſions to the merchants, and the duty to the king, are almoſt all the advantages that kingdom derives from her commerce with the *Indies*. The warehouſes of *La Vera Cruz* are conſtantly full of *European* goods and commodities, and its trade may be reputed nearly equal to all the commerce of *Spaniſh America*, though it is chiefly confined to the time the flota ſtays there.

The province of TABASCO, which is waſhed on the N. by the *Bay of Campeachy*, is the place where logwood principally grows; the land near the coaſt is generally ſo flat and low, that it rains nine months every year; and, according to *Dampier*, remains under water ſix or ſeven months, during which the logwood-cutters uſually work up to the knees in mud and water whilſt felling the trees, and can ſcarce find a dry ſpot to build their huts on. On the coaſt are almoſt impenetrable thickets of mangroves and bamboos; but farther up the country are fine ſavannahs and gentle riſing hills, adorned with variety of fruit trees; and the banks of the river *Tabaſco* are ſhaded with large trees, particularly cabbage trees a hundred feet high.

The province of JUCATAN, or YUCATAN, is a peninſula ſeated in the *Gulf of Mexico*, between the bays of *Campeachy* and *Honduras*, and is generally flat low land, with ſcarce any hills, unleſs on the weſtern part. It is thinly inhabited, for the air is exceſſively hot, and the lands near the coaſt frequently under water. Its chief produce is logwood, cotton, and ſalt. The only *Spaniſh* town in this extenſive coaſt is *Campeachy*, ſeated on the W. ſide of the peninſula facing the ſea, and has a fine appearance, it being built of ſtone, and encompaſſed with a good wall; alſo a ſtrong citadel mounted with ſeveral pieces of heavy cannon, placed at one end for its defence.

The audience of GUATIMALA forms a very fine country, capable of great improvements. It is bounded on the N. W. by that of *Mexico*; on the N. E. by the gulf of *Mexico*; on the S. E. by the province of *Darien* or *Terra Firma*; and on the S. W. by the *Pacific Ocean*; thus enjoying every advantage of ſituation with reſpect to commerce. It is about a thouſand miles in length from the N. W. to the S. E. but ſcarce half ſo broad in any part, and in ſome not a hundred miles in breadth: it is ſubdivided into the ſix following provinces: *Guatimala Proper*, *Vera Paz*, *Honduras*, *Nicaragua*, *Coſta Rica*, and *Veragua*; the two laſt provinces are, however, placed by *Antonio de Ulloa* within *Terra Firma*.

ST. JAGO DE GUATIMALA, formerly the capital of the audience, and one of the fineſt cities in *New Spain*, was deſtroyed in the year 1751 by a dreadful earthquake, attended by an irruption from a neighbouring volcano. An hundred and twenty thouſand *Spaniards* and natives are ſuppoſed to have periſhed.

NEW GUATIMALA, the preſent capital of the audience and province, the reſidence of the preſident and royal courts, the ſee of a biſhop, the ſeat of an univerſity, and the centre of the trade of theſe parts, is ſeated in a delightful plain at a diſtance from the fatal volcano; yet this city is alſo expoſed to the dreadful earthquakes which are ſo frequent in this country.

Of the different Ranks of People among the preſent MEXICANS; *with the Manners, Cuſtoms, and Government, of the* SPANIARDS *and* CREOLES.

MEXICO is inhabited by a mixed people, conſiſting of the native *Indians*, the *Spaniards*, and the negroes; the deſcendants of theſe are alſo divided and diſtinguiſhed by various names; as, the unmixed deſcendants of the *Spaniards*, who are called *Creoli*, or *Creoles*; the *Meſtizes*, or iſſue of the *Spaniards* by the native *Indians*; the *Meſtiches*, or the iſſue of ſuch iſſue; the *Tenceroon des Indies*, or the children of the laſt married to the *Spaniards*; and the *Quarteroons des Indies*, who are their deſcendants, and are allowed the ſame privileges as true *Spaniards*. The iſſue of an *European* and negro is called a mulatto; beſide which there is a mixed breed of negroes and *Indians*, which is generally deemed the loweſt rank of the people.

The whites are either born in *Spain*, or *Creoles*: the native *Spaniards* are moſtly in offices and in trade, and have the ſame characters and manners with the *Spaniards* of *Europe*: the ſame gravity of behaviour, the ſame natural ſagacity, but a ſtill greater ſhare of pride and ſtatelineſs; for they here conſider their being natives of *Old Spain* as a very honourable diſtinction, and are, in return, looked upon by the *Creoles* with no ſmall ſhare of hatred and envy. The latter have little of that firmneſs and patience which diſtinguiſhes the native *Spaniards*. They are deſtitute of courage, weak, and effeminate. Living in an enervating heat, ſurfeited with wealth, and ſpending their whole time in loitering and inactive pleaſures, they have nothing bold and manly, to fit them for making a figure in active life, and very few have any taſte for the ſatisfactions of learned leiſure. They are luxurious without either variety or elegance; fond of ſhow and parade; temperate at their tables and in their cups, and, merely from conſtitution and idleneſs, make their whole buſineſs amour and intrigue, which they carry on in the old *Spaniſh* taſte, by doing and ſaying extravagant things, by bad muſic, worſe poetry, and exceſſive expences. The ladies are little celebrated for their chaſtity or domeſtic virtues, but exert all their genius and abilities in combating the reſtraints which are laid upon them.

It is allowed by the moſt judicious authors, that the prieſts, monks, and nuns of all orders compoſe more than one fifth of all the white people; but the clergy being here generally too ignorant to inſtruct by preaching, and too debauched in their manners to reform by their example, the people are little bettered either by their numbers, their wealth, or their influence. Many of them are ſaid to be adventurers from *Old Spain*, who, without the leaſt regard to their character or their vows, direct all their ſtudies to raiſe a ſudden fortune, by abuſing the ignorance and extreme credulity of the people. Much attention is paid to a mere mechanical routine of devotion. Moral duties are ſeldom enforced. An extreme veneration for ſaints is ſtrongly inculcated, and forms the general ſubject of their ſermons, which are rather deſigned to raiſe a ſtupid admiration of pretended miracles, than to excite an imitation of their ſuppoſed ſanctity of life. However, it muſt be acknowledged, that there are ſome of the clergy who practiſe the duties of their ſtation, and are diſtinguiſhed by their learning and the purity of their manners; but theſe are very few.

As to the laity, it is ſaid there is not a more biggotted, or a lewder people upon earth: a preſent to the church wipes off the odium and the puniſhment of the greateſt crimes. The prevailing mode of inſtruction in religion, is by theatrical entertainments in their churches. There is ſcarce any part of the Goſpel but is the ſubject of a play, which the people are here trained to act: one perſonates our Saviour, another Pilate, a third Herod, and ſo on. As their churches are exquiſitely fine, ſo is their muſic, both vocal and inſtrumental. The clergy collect the moſt harmonious voices, and have them taught to ſing not only anthems, but merry ſongs; and in their cloiſters are maſques, dances, and all the entertainments in which the laity indulge themſelves; and yet the people have their ſeaſons for penance and mortification, particularly in *Lent*, when they not only keep a rigorous faſt, but in their proceſſions laſh themſelves unmercifully. This is the exerciſe in the holy week before *Eaſter*; and in caſe of an earthquake, famine, or other general calamity, they endeavour by theſe auſterities to appeaſe the wrath of heaven.

The civil government, which is adminiſtered by tribunals called audiences, conſiſts of a certain number of judges divided into different chambers. The viceroy himſelf preſides at the head of the chief of theſe chambers, when he ſees fit. His appointment is one of the greateſt the king of *Spain* has in his gift, being perhaps the richeſt government entruſted to any ſubject in the world. All employments here are held by native *Spaniards* only, and by them only for a limited time, which muſt not exceed three years. Jealouſy and avarice in this, as well as in every thing elſe that has a relation to the *Indies*, influence all public regulations; and every officer, from the higheſt to the loweſt, has the avidity which a new, a lucrative, and a temporary poſt inſpires; ravenous, becauſe his time is ſhort, he oppreſſes the people, and defrauds his ſovereign; another ſucceeds him with the ſame diſpoſitions; and no man takes care to eſtabliſh any thing uſeful in his office, knowing that his ſucceſſor will trample upon every regulation that is not ſubſervient to his own intereſt.

There are ſome troops kept in *Mexico*, and a good revenue appropriated for their maintenance, and for the ſupport of the fortifications; but the ſoldiers are few, ill-cloathed, ill-paid, and worſe diſciplined.

Of the Perſons, Dreſs, Manners, Cuſtoms, Houſes, Food, and Feſtivals of the MEXICANS; *particularly of thoſe who are detached from the* SPANIARDS, *and ſtill enjoy their Liberty.*

THE original *Mexicans*, like the other *Americans*, are in general tall, clean-limbed, well-proportioned, and handſome; active, nimble, and remarkably ſwift of foot. They are of a deep olive complexion; their eyes large, lively, and ſparkling; the face round, and the features uſually agreeable. They wear their hair, either flowing looſe, cut ſhort, or twiſted and plaited on the head. Some nations within the limits of this vaſt country differ widely from the general appearance and manners of the reſt; a few deem flat noſes the greateſt ornament, and early flatten thoſe of their infants, to produce that beauty on their faces; while others mould their thin tender ſkulls into a conical or pyramidical form, by means of compreſſion. Many of the *Mexicans* diſfigure themſelves with paint, or rather daubing, and repreſent on the body the figures of various birds and beaſts; or, in time of war, paint their faces red, to give them a warlike and bloody appearance; they alſo anoint their bodies with oil or fat, to prevent their being bit by muſkettoes, to preſerve the ſkin againſt the intenſe heat of the ſun, and to render their joints ſupple and pliant.

The people are however in general clothed, though in a very different manner from the *Spaniards*.

In general the *Indians* are fond of pendants, bracelets, and necklaces. The men wear a thin plate of gold or ſilver hanging over their upper lip, of an oval figure, in the form of a creſcent, the points of which gently pinch the bridle of the noſe, and ſerve to faſten it on; the middle is about the thickneſs of a guinea, and it grows gradually thinner toward the edges. The women, inſtead of a plate, wear a ring, which goes through the bridge of the noſe, and by its weight ſometimes draws it down to the mouth. Theſe ſtrange kinds of ornaments they have of various ſizes; the larger ſort they lay aſide at their entertainments, and the ſmaller do not hinder their eating. Their great men likewiſe wear two gold plates in the ſhape of a heart, a ſpan long at each ear, faſtened to it by a gold-ring, which ſtretches the ear to an immoderate ſize. They alſo wear a kind of coronet or bandage of gold or ſilver about the head, eight or ten inches broad, and indented on the upper ſide; others have only a bandage of cane painted red, ſtuck round with beautiful feathers, ſtanding upright; and moſt of the *Indians* of both ſexes wear ſtrings of beads, teeth, ſhells, and other toys, hanging from the neck down to the breaſt.

Thoſe *Indians* who live in the *Spaniſh* towns wear a ſhort waiſtcoat and wide breeches, with a ſhort cloak of various colours, reſembling the *Spaniſh* dreſs; but their legs are bare, and only a few cover their feet with ſandals. The women wear a ſhort jacket of cotton, or linen, over which flows a looſe robe, or a ſtraight petticoat, and ſometimes both. There are, however, ſuch varieties in dreſs, depending upon cuſtom and fancy, that it would be endleſs to enter upon particulars.

With reſpect to the genius, temper, and manners of the *Mexicans*, they ſeem to have greatly degenerated ſince they were conquered by the *Spaniards*. They were once ingenious, hoſpitable, civilized, and generous, except in the articles of human ſacrifices; but now thoſe who live among the *Spaniards* are ſaid to be cowardly, treacherous, and ſtupid. The buildings, images, paintings, carvings, cotton-cloths, manufactured feathers formed into beautiful pictures, and many other pieces of art, evince the genius of the ancient *Mexicans*; and the loſs of theſe is a demonſtration of the decline of that genius. Indeed, the cauſe is not difficult to be aſſigned; their temples and images, on which they had laviſhed all the powers of art, being deſtroyed, themſelves reduced to a ſtate of ſervitude, and conſtrained to labour in the mines, to gratify the avarice of their new maſters, it is not ſurpriſing that they no longer cultivate and improve their mental powers, which would only turn to their deſtruction, and gain them ſtripes inſtead of rewards. Beſide, the introduction of *European* arts, manufactures, and the implements of mechanics, made the *Indians* deſpiſe the inferiority of their own, all knowledge of which they ſoon forgot, without being able to acquire any degree of ſkill in the other, to the drudgery and lower branches of which they were confined.

The ancient *Mexicans*, when firſt viſited by the *Spaniards*, appeared to poſſeſs, among other polite arts, a conſiderable ſkill in painting. Many ſpecimens of their talents in this art were ſaved from the general deſtruction which overwhelmed that devoted people. A collection of *Mexican* paintings, conſiſting of ſixty-three pieces, was made by *D. Antonio Mendoza*, the firſt biſhop of *Mexico*, with a deſign to preſent them to the emperor *Charles* V. but the veſſel which conveyed them being captured by a *French* corſair, they were carried into *France*. The paintings fell into the hands of *Thevenot*, geographer to the *French* king; of his heirs they were purchaſed, at a high price, by *Hackluit*, then chaplain to the *Engliſh* ambaſſador at the court of *France*. They then paſſed into *England*, where the *Spaniſh* interpretations were tranſlated into the *Engliſh* language by the procurement of Sir *Walter Raleigh*, at the requeſt of Sir *Henry Spelman*, and publiſhed by *Purchas*, in the 3d volume of his collection. In the year 1692 they were printed at *Paris*, with a *French* interpretation, by *Thevenot*, in the ſecond volume of his work, entitled *Relation de divers Voiages Curieux*. *Acoſta* mentioned ſome painted *Mexican* annals which were in the *Vatican* library in his time. Whether theſe paintings are yet preſerved is not known, but eight other paintings are ſaid to be ſtill ſhewn in the library of the palace at *Vienna*. They were preſented by *Emanuel* king of *Portugal* to pope *Clement* VII. and after having paſſed through the hands of ſeveral illuſtrious proprietors, came into the poſſeſſion of the cardinal of *Saxe Eiſenach*, who preſented them to the emperor *Leopold*.

Thoſe *Indians* who have preſerved their freedom in the mountains and ſome other parts of the country, are ſtill a brave, generous, and humane people, entirely untainted with the ſordid vices and corrupt manners of the inhabitants of the *Spaniſh* cities and towns. They ſpend their time in hunting, fiſhing, and field exerciſes; cultivate but little ſoil, ſow and plant what is juſt ſufficient to provide for the calls of nature, and allow nothing for the gratification of appetites created by luxury.

The buſineſs of planting is performed by the women, after the men have cleared the ground. The females likewiſe execute all the domeſtic offices, ſpin, weave, and dreſs cotton and linen-cloth for their own or their huſbands apparel.

The free *Indians* live in thatched cottages, and obſerve little regularity in their towns; their houſes neither ſtanding contiguous, nor in any order, but are diſperſed at random; only they have one common guard-houſe, or fort, which is ſeated on an eminence, to which they reſort on the approach of an enemy, or when they aſſemble in council. They never lay any deep foundations, but ſet up ſmall poſts ſeven or eight feet high, two or three feet aſunder, and, cloſing up the intervals, cover them with clay. They conſtruct the roof like that of an ordinary barn, and uſually cover it with palmetto-leaves. Theſe buildings are about twenty-four feet long, and twelve broad; the hearth is in the middle, and they have a hole over it, to let out the ſmoke: they have only a ground-floor, and make no partitions, ſo that the whole houſe forms but one room. Inſtead of beds they uſe hammocks, which are hung from the principal beam, and blocks of wood are their only ſeats and tables. Their furniture conſiſts of earthen veſſels, with calabaſhes of an uncommon ſize to hold their liquor; and their bows, arrows, lances, darts, and quivers, with their tools, are hung as ornaments round the cottage.

We ſhall cloſe this ſubject with the character given of the *Mexicans*, by the abbé *Clavigero*. "Their ſenſes," ſays that writer, "are very acute, eſpecially that of ſight, which they enjoy unimpaired to the greateſt age. Their conſtitutions are ſound, and their health robuſt. They become grey-headed and bald ſooner than the *Spaniards*, and although moſt of them die of acute diſeaſes, it is not very uncommon for them to attain to the age of an hundred. They are very moderate in eating, but their paſſion for ſtrong liquors is carried to the greateſt exceſs. Their minds are in every reſpect like thoſe of the other children of *Adam*, and endowed with the ſame powers. The ſtate of civilization among the *Mexicans*, when they were firſt known to the *Spaniards*, was much ſuperior to that of the *Spaniards* themſelves, when they were firſt known to the *Phœncians*, that of the *Gauls* when firſt known to the *Greeks*, or that of the *Germans* or *Britons* when firſt known to the *Romans*. Their underſtandings are fitted for every kind of ſcience, as experience has actually ſhewn. Of the *Mexicans* who have had an opportunity to engage in the purſuits of learning, which amount to but a ſmall number, as the greateſt part of the people are always employed in the public or private works, we have known ſome good mathematicians, excellent architects and learned divines. Many perſons allow the *Mexicans* to poſſeſs a great talent of imitation, but deny them the praiſe of invention: a vulgar error, which is confuted by the ancient hiſtory of that people. Their minds are affected by the ſame variety of paſſions with thoſe of other nations, but not to an equal degree. The *Mexicans* ſeldom exhibit thoſe tranſports of anger, or thoſe frenzies of love which are ſo common in other countries. They are ſlow in their motions, and ſhew a wonderful tenacity and ſteadineſs in thoſe works which require time, and long continued attention. They are moſt patient of injury and hardſhip; and where they ſuſpect no evil intention, are moſt grateful for any kindneſs ſhewn. They are by nature taciturn, ſerious, and auſtere, and ſhew more anxiety to puniſh crimes than to reward virtues. Generoſity and perfect diſintereſtedneſs are the principal features of their character. Gold, with the *Mexicans*, has not that value which it enjoys elſewhere; they give without reluctance what has coſt them the utmoſt labour to acquire. The neglect of ſelfiſh intereſts, together with the diſlike which they bear to their rulers, and conſequently their averſion to the taſks impoſed by them, ſeem to have been the only grounds of that much exaggerated indolence with which the *Americans* have been charged; and, after all, there is no ſet of people in that country who labour more, or whoſe labours are more eſſentially uſeful. Courage and cowardice ſeem alternately ſo to affect their minds, that it is often difficult to determine whether the one or the other predominates. They meet dangers with intrepidity when they proceed from natural cauſes, but they are eaſily terrified by the ſtern look of a *Spaniard*."

SECT. II.

Of TERRA FIRMA, *or* NEW CASTILE.

THE province of *Terra Firma*, or *New Caſtile*, is a very extenſive country, it being bounded on the N. and E. by the *Atlantic Ocean*; on the S. by part of *Guiana* and the country of the *Amazons*; and on the W. by the *South Sea*, where the *Iſthmus of Darien* alſo divides it from *Mexico*. Its greateſt length from the *South Sea*, to the mouth of the river *Oroonoko*, is upward of thirteen hundred miles, and its greateſt breadth is about ſeven hundred and fifty; but in other places it is much pent in by the river *Oroonoko*, ſo that it is not above half that breadth, and toward the mouth of that river not above a hundred and eighty miles. It extends almoſt from the equator to 12°. 18′. N. latitude, and from 60°. 20′. to 80°. W. longitude.

TERRA FIRMA is divided into the following diſtricts, or governments: the *Iſthmus of Darien*, or *Terra Firma Proper*, *Carthagena*, *Santa Martha*, *Rio de la Hacha*, *Venezuela*, *New Granada*, *New Andaluſia*, and the province of *Popayan*.

The moſt northern of theſe is the country lying between the *Gulf of Darien* and *Mexico*, along the coaſt of the *Atlantic* and *Pacific Oceans*, particularly diſtinguiſhed by the name of the *Iſthmus of Darien*, and by ſome writers called the *Iſthmus of Panama*. It divides *North* and *South America*, extending between 8°. and 10°. N. latitude, and between 78°. and 87°. 30′. W. longitude, in the form of a creſcent, round the *Bay of Panama*, for about three hundred miles in length, and ſixty in breadth, from the *Atlantic* to the *Pacific Ocean*. It is bounded on the E. by the river and *Gulf of Darien*, which ſeparates it from *Carthagena*; on the S. by *Popayan* and the *Pacific Ocean*; and on the W. by the ſame ocean and *Veragua*.

The land has almoſt every where an equal ſurface, and is diſtinguiſhed by hills and vallies of great variety for height, depth, and extent. The vallies are generally watered with rivers, brooks, and perennial ſprings, ſome of which fall into the *North Sea*, and others into the *South Sea*: moſt of them riſe from a chain of the higheſt hills that extend the length of the iſthmus, in a manner parallel to the ſhore, and neareſt to the *North Sea*, from which it is ſeldom above ten or fifteen miles diſtant. On the N. ſide of this main ridge, which is a continuation of the *Andes*, the land is either level or riſes in gentle declivities. This ſide of the country is every where ſo covered with wood, that it is one continued foreſt: nor is the main ridge itſelf carried on every where with a continued top; but is rather a range of diſtinct hills, frequently ſeparated by large vallies disjoining the ſeveral eminences that compoſe its length: and ſome of them are ſo deep, as to admit a paſſage for rivers.

Some of the rivers which water the country are pretty large, though few of them are navigable. On the N. coaſt they are generally ſmall; for as they riſe from the main ridge, which lies near that ſhore, they have but a ſhort courſe. The *Chagre* is a conſiderable river; for though it riſes from the ſame ridge, it has a long bending courſe from the S. and E. part of the *Iſthmus*. The river *Conception* is alſo conſiderable; theſe fall into the *North Sea*. Into the *South Sea* fall the *Santa Maria*, the *Congo*, and the *Cheapo*.

In the river *Chagre* are bred a great number of alligators; and all the foreſts and woods near it abound with wild beaſts, eſpecially different kinds of monkies, of various colours, as black, brown, and reddiſh; there is alſo the ſame diverſity in their ſize, ſome being a yard long, others half a yard, and others ſcarce a foot. The fleſh of all theſe different kinds is highly eſteemed by the negroes, eſpecially that of the red; "but, however delicate the meat may be," ſays Don *Ulloa*, "the ſight of them is enough to excite a loathing; for when dead they are ſcalded, in order to take off the hair, whence the ſkin is contracted by the heat; and when thoroughly cleaned looks perfectly white, and greatly reſembles a child of about two of three years of age: yet the ſcarcity of food in many parts of *America* renders their fleſh valuable; and not only the negroes, but the *Creoles*, and the *Europeans* themſelves, make no ſcruple of eating it."

The principal towns in this province are *Porto Bello* and *Panama*.

The town of ST. PHILIP DE PORTO BELLO is ſituated in 9° 33′ N. latitude, and in 79° 50′ W. longitude, from *Greenwich*, and ſtands on the declivity of a mountain that ſurrounds the whole harbour. Moſt of the houſes are built of wood; but in ſome the firſt ſtory is of ſtone, and the reſt of timber. The town conſiſts of one principal ſtreet, extending along the ſtrand, with ſmaller ſtreets interſecting it, and running from the declivity of the mountain to the ſhore. There are alſo ſome lanes in the ſame direction with the principal ſtreet, where the ground admits of it. Here are two large ſquares, one oppoſite to the cuſtom-houſe, which is of ſtone, adjoining to the quay; the other faces the great church, which is alſo of ſtone, large, and decently ornamented. Here are alſo two other churches, one called *Neuſtra Signora de la Merced*, with a convent of the ſame order; but both the church and convent are mean and ruinous; the other is *St. Juan de Dios*, which is a ſmall building, in no better condition than the former.

At the E. end of the town is a quarter called *Guinea*, where the negroes of both ſexes, whether ſlaves or free, have their habitations. This quarter is much crowded when the galleons are here. The mulattoes and other poor families alſo remove either to *Guinea*, or to cottages ſtanding near it, or erected for the occaſion. Great numbers of artificers from *Panama*, which flock to *Porto Bello* to work at their reſpective buſineſſes, likewiſe lodge in this quarter, as here accommodations may be procured on the loweſt terms. Toward the ſea is a large tract of land between the town and *Gloria caſtle*, where barracks are erected, which are principally filled with the crews of ſhips, who keep ſtalls of ſweetmeats and other eatables which are imported from *Spain*; but at the concluſion of the fair the ſhips put to ſea, and all theſe buildings are taken down; when the town, from being a ſcene of buſtle and buſineſs, exhibits nothing but inert tranquillity.

Its name was given it by *Columbus*, to ſignify *Fine Port* or *Harbour*, and though its entrance is very wide, it is well defended by *Fort St. Philip*. On the S. ſide of the harbour, oppoſite to the anchoring-place, is a large caſtle, called *St. Jago de la Gloria*, to the E. of which, at the diſtance of two hundred yards, begins the town, having before it a point of land projecting into the harbour, on which ſtood a ſmall fort, called *St. Jerom*. All theſe were demoliſhed by admiral *Vernon*, in 1739, with only ſix ſhips under his command. Among the mountains which ſurround the whole harbour, is one at its utmoſt extremity, remarkable for ſuperior height. Its top is always covered with clouds, of a denſity and darkneſs ſeldom ſeen in thoſe of this atmoſphere: when theſe thicken and increaſe in blackneſs, and ſink below their uſual ſtation, it is a ſure ſign of a tempeſt; while, on the other hand, their clearneſs and aſcent as certainly indicate the approach of fair weather. Theſe changes, however, are very frequent and ſudden.

The town is under the juriſdiction of a governor, who has the title of lieutenant-general; he is always a military officer, and ſuperintends the commandants of the forts which ſecure the harbour. To theſe his juriſdiction is limited, the neighbouring country conſiſting of mountains overſpread with impenetrable foreſts.

The climate of *Porto Bello* is extremely inclement: the heat is exceſſive, being increaſed by the ſituation of the town ſurrounded by high mountains, without any interſtices to admit refreſhing winds. Theſe mountains are ſo thickly overſpread with trees that the vapours are ſtrongly attracted, and the rains which fall are copious and long continued: they are frequently accompanied with dreadful tempeſts of thunder and lightning; the peals of the former are reverberated by the echoes from the caverns of the mountains, and followed by the howlings and ſhrieks of the many kinds of monkies which dwell in theſe foreſts: but what is yet a greater evil, the air is rendered ſo unhealthy, that the galleons, or other *European* ſhips, which remain here any length of time, ſeldom quit the place without burying half, or at leaſt one third of their men: hence it has been termed the grave of the *Spaniards*. It is univerſally aſſerted in that town, that the animals from other climates, on their being brought to *Porto Bello*, ceaſe to propagate their ſpecies; thus hens brought from *Panama* or *Carthagena* no longer produce eggs. The horned cattle ſent from *Panama*, after continuing here a ſhort time, loſe their fleſh, and become unfit for food, although there is no want of paſture.

The number of inhabitants, from the inclemency of the climate, is very inconſiderable, and the greateſt part of theſe are negroes and mulattoes, there being ſcarce thirty white families; for none remain at *Porto Bello* but thoſe whoſe employments compel them, ſuch as the governor, the commanders of the forts, the civil officers of the crown, with the officers and ſoldiers of the garriſons.

Proviſions are ſcarce, and conſequently dear, particularly during the ſtay of the galleons and the fair, when there is a neceſſity of a ſupply from *Carthagena* and *Panama*. The only plentiful thing here is fiſh, of which there is a great variety, and very good. The adjacent country alſo abounds in ſugar-canes, and they make ſugar, molaſſes, and rum.

Snakes are here extremely numerous, and *toads* innumerable, ſwarming not only in damp and marſhy places, as in other countries, but even in the ſtreets, courts of houſes, and in all open places. Thus, when it has rained in the night, the ſtreets and ſquares in the morning ſeem paved with them; ſo that a paſſenger can ſcarce ſtep without treading upon them, which is ſometimes productive of troubleſome bites; for, beſide the poiſon emitted, they are ſo large that their teeth inflict a painful wound. Theſe toads are generally about ſix inches in length, and nothing can be imagined more diſmal than their croakings during the night, in all parts of the town, as well as in the woods and caverns on the mountains.

As the foreſts almoſt border on the houſes, the *tygers* often enter the ſtreets during the night, carrying off fowls, dogs, and other domeſtic animals, and ſometimes even children have fallen a prey to them. Beſide the ſnares uſually laid for them, the negroes and mulattoes who fell wood in the foreſts of the mountains are very dexterous in encountering them, and ſome even ſeek them in their retreats. It is cuſtomary on a tyger being killed, for the victor to ſtrip off the ſkin, cut off the head, with the fore and hind feet, and paſs through the town with theſe trophies of his victory.

To return to *Porto Bello*, which, though ſo thinly inhabited, on account of its noxious air becomes on the arrival of the galleons one of the moſt populous places in all *South America*; for its ſituation on the *Iſthmus*, between the two great oceans, the goodneſs of its harbour, and its ſmall diſtance from *Panama*, have given it the preference for the rendezvous of the joint commerce of *Spain* and *Peru*.

The inhabitants of *Carthagena* no ſooner receive advice that the *Peru* fleet has unloaded at *Panama*, than the galleons ſet ſail for *Porto Bello*, where the concourſe of people is immediately ſo great, as to raiſe the rent of a middling chamber with a cloſet, during the fair, to a hundred crowns; and ſome large houſes are let for that ſeaſon at four, five, or ſix thouſand crowns.

As ſoon as the ſhips are moored in the harbour a tent is erected in the ſquare, with the ſails of the ſhips, for receiving their cargo, and thither the bales are drawn on ſledges by the crew of every ſhip. While the ſeamen and *European* traders are thus employed, the land is covered with droves of mules from *Panama*, each drove conſiſting of above a hundred, loaded with cheſts of gold and ſilver, on account of the merchants of *Peru*. Some unload them at the *Exchange*, and others in the middle of the ſquare; yet, amidſt the hurry and confuſion of ſuch crowds, theft, loſs, or diſturbance, is unknown.

After the ſhips are unloaded, and both the merchants of *Peru* and the preſident of *Panama* are arrived, the deputies of the ſeveral parties repair on board the commodore of the galleons, where, in the preſence of the commodore and the preſident of *Panama*, the former as patron of the *Europeans*, and the latter of the *Peruvians*, the price of the ſeveral kinds of merchandize is ſettled, and all preliminaries being adjuſted in three or four meetings, the contracts are ſigned and made public, that every one may conform to them in the ſale of his effects. Thus all fraud is precluded. The purchaſes and ſales, with the exchange of money, are tranſacted by brokers, both from *Spain* and *Peru*. After this every one begins to diſpoſe of his goods; the *Spaniſh* brokers embarking their cheſts of money, and thoſe of *Peru* ſending away the goods they have purchaſed in veſſels called chatas, and bongos, up the river *Chagre*, and thus the fair of *Porto Bello* ends.

Few places have received more hoſtile viſits than this town: in the year 1595 it was taken by Sir *Francis Drake*, and ranſomed: in 1601 it was ſurpriſed by captain *Parker*: and in 1669 taken by captain *Morgan*: in 1678 by captain *Croxon*: and in 1739 by admiral *Vernon*.

PANAMA, firſt founded in the year 1518, the moſt important place in the province, is built on the coaſt of the *South Sea*, in 8° 48′ N. latitude, and 80° 21′ W. longitude, from *Greenwich*. The houſes in general are of ſtone, but are only one ſtory high: the ſymmetry of the windows gives them a handſome appearance. Without the walls is an open ſuburb, larger than the city itſelf, and contains houſes of the ſame materials and conſtruction. The decorations of the private houſes are elegant, but not coſtly; for though no perſons reſide here who are poſſeſſed of ſuch immenſe fortunes as individuals in ſome other cities in *America*, yet it is not deſtitute of wealthy inhabitants, and a competency is very generally enjoyed.

This city, in the year 1670, was ſacked and burned by *John Morgan*, an *Engliſh* buccaneer, who had before taken *Porto Bello* and *Maracaybo*.

Commodore *Anſon*'s expedition into the *South Sea*, in the year 1740, was undertaken principally for the purpoſe of attacking *Panama*, whilſt admiral *Vernon*, with a more conſiderable naval force, was to attack the *Spaniſh* ſettlements on the oppoſite ſide of the *Iſthmus*; but a plan ſo comprehenſive, and, if ſucceſsfully carried into execution, ſo big with ruin to the intereſt of *Spain*, was early known to the *Spaniſh* court, ſo that a fleet was fitted out to oppoſe the *Engliſh* in the *South Sea*, and their governors in *America* were appriſed of the hoſtile attacks which were intended. Still, however, the deſign was not fruſtrated by the plans of the *Britiſh* cabinet being betrayed, but from many other cauſes, ſuch as, the time which was ſpent in doubling cape *Horn*, the ravages made on board the commodore's ſhips by the ſea-ſcurvy, and the failure of admiral *Vernon* before *Carthagena*.

In this city is a tribunal, or royal audience, in which the governor of *Panama* preſides; and to this employment is annexed the poſt of captain-general of *Terra Firma*. The city has alſo a court of inquiſition, a cathedral, and a chapter, conſiſting of a biſhop, and a number of prebendaries. The cathedral and convents are of ſtone; the latter are thoſe of the *Dominicans*, *Franciſcans*, *Auguſtines*, and fathers of *Mercy*; a college of *Jeſuits*, now aboliſhed, a nunnery of the order of *St. Clara*, and an hoſpital of *St. Juan de Dios*.

The harbour is formed in the road by the ſhelter of ſeveral iſlands, where ſhips lie in ſafety. From the bottom of the ſea pearls are procured in great abundance, and the oyſters in which they are found are remarkably delicious. This kind of fiſhery is of great advantage to the inhabitants of the iſlands; it will be ſpoken of when treating of the trade of *Panama*.

The inhabitants are deſcribed as parſimonious, deſigning, inſidious, and greedy of gain; for the obtaining which they ſcruple no kind of means. The ſame diſpoſitions prevail equally among the women: theſe, when they go abroad, imitate the dreſs of thoſe of *Peru*, which conſiſts only of a gown and petticoat, nearly reſembling thoſe worn in *Spain*; but at home, on viſits, and upon ſome particular ceremonies, their ſhift is the only cloathing from the waiſt upward. The ſleeves are very long, broad, and quite open at the wriſt; and theſe, like the boſoms, are adorned with very fine lace, in which conſiſts the chief pride of the ladies of *Panama*. They wear girdles, and five or ſix chaplets of beads about their necks; ſome ſet in gold, ſome of coral, mixed with ſmall pieces of gold, and others leſs coſtly, but all of different ſizes; beſide theſe, they have one, two, or more gold chains, from which hang ſome relicks. Round their arms they wear bracelets of gold and tombac; alſo ſtrings of pearls, corals, and bugles. Their petticoat reaches only from their waiſt to the calf of their legs, and from thence a broad lace hangs down nearly as low as the ancles.

The land in the neighbouring country receives no cultivation, nor does the leaſt veſtige remain of its having been formerly rendered prolific; ſo that the inhabitants are ſupplied with every neceſſary, either from the coaſt of *Peru*, or from diſtant places in the juriſdiction; whence *Panama* is plentifully furniſhed with the beſt wheat, maize, cattle, and poultry, and the inhabitants, from living on a more ſalubrious ſpot, are not ſo meagre and pale as thoſe of *Carthagena* and *Porto Bello*.

From what has been ſaid of the commerce of *Porto Bello* in the time of the galleons, an idea may be formed of that of *Panama* on the ſame occaſion; this city being the firſt where the treaſure from *Peru* is landed, and likewiſe the ſtaple for the goods brought up the river *Chagre*. This commerce is of the greateſt advantage to the inhabitants, as it procures them tenants for their houſes, freight for their veſſels, and employment for their mules and negroes. The city, during the abſence of the flota, has always a great number of ſtrangers, it being the thoroughfare for all who go to the ports of *Peru* in the *South Sea*, as alſo for ſuch as come from thence to *Spain*; to which muſt be added the continual trade carried on by the *Peruvian* ſhips, which bring variety of goods; as meal of different ſorts, wine, brandy, ſugar, olives, oil, tallow, leather, and the like. The ſhips from *Guaquil* bring cacao, and quinquina, or *Jeſuit*'s bark. The coaſting barks, which make frequent trips from the adjacent ports, ſupply the city with hogs, poultry, hung-beef, hog's-lard, plantains, roots, and other food. The dearneſs of proviſions in the city and its diſtrict, cauſed by the great diſtance whence they are brought, is amply compenſated by the multitude and value of the pearls obtained in the gulf, particularly thoſe near the iſlands of *Del Rey*, *Tabaga*, and others, amounting in the whole to forty-three in number, which form a ſmall *Archipelago*.

Pearls are found in ſuch abundance, that there are few perſons of ſubſtance near *Panama* who do not employ ſome of their ſlaves in this fiſhery, which is performed in the following manner:

The owners of negroes employ ſuch as are both expert ſwimmers, and are capable of holding their breath a long time: theſe they ſend to the iſlands, where they have huts built for their lodgings, and boats that hold eight, ten, or twenty negroes, under the command of an officer. In theſe boats they go to ſuch parts as are known to produce pearls, where the depth of the water does not exceed twelve or fifteen fathoms. Here they come to an anchor, and the negroes having a rope faſtened round their bodies, and the other end to the ſide of the boat, carry with them a ſmall weight to accelerate their ſinking. On reaching the bottom, they take up an oyſter, which they put under their left arm, a ſecond they hold in their left hand, and a third in their right; with theſe three oyſters, and frequently another in their mouth, they riſe to take breath. When they have put their oyſters in a bag, and recovered their breath, they perform a ſecond diving; and thus continue till they have completed their taſk, or their ſtrength fails. Each of theſe divers is obliged to deliver daily to his maſter a certain number of pearls; ſo that when they have procured the proper number of oyſters, they begin to open them, and deliver the pearls to the officer, till they have completed the number required: if the pearl be but formed, it is ſufficient, no regard being paid to its ſize; the remainder, however large or beautiful, are the negro's property, the maſter not laying claim to them, ſo that the ſlaves are allowed to ſell them to whom they pleaſe, though they are generally purchaſed at a very ſmall price by the maſter. The negroes cannot however every day make up their number, and therefore are obliged to ſupply the deficiency when they prove ſucceſsful.

Beſide the fatigue of this fiſhery, from the ſtrong adherence of the oyſters to the rocks, and the riſk of drowning, theſe divers are in no ſmall danger from ſeveral kinds of fiſh who reſort here. The *tintoreras* and *taburones*, fiſh of an enormous ſize, feed on the bodies of theſe unfortunate fiſhermen; and the *mantas* or *quilts* preſs them to death; wraping its fins round a man or any other animal that comes within its reach, immediately deprives it of life by the preſſure. This fiſh, though of a prodigious ſize, in ſhape reſembles a thornback.

Each negro is provided with a ſharp knife to defend himſelf againſt theſe enemies, who retire when oppoſed by ſuch a weapon. The officers in the boats likewiſe keep a watchful eye on theſe voracious animals, and on diſcovering them, ſhake the rope faſtened to the negro's body, to put him on his guard; and many, upon ſeeing the divers in danger, have thrown themſelves into the water, and deſcended to attack the monſter: but too often all attention, dexterity, and courage, are ineffectual to ſave the diver from being devoured, or loſing a limb: ſeveral methods have been taken to prevent theſe melancholy accidents, but none have been found effectual.

The pearls of theſe fiſheries are generally of a good water, and ſome remarkable for their ſhape and ſize. A few of them are ſent to *Europe*, but the greateſt part are carried to *Lima*, where the demand for them is very great, they being not only univerſally worn there by perſons of rank, but likewiſe ſent into the inland parts of *Peru*.

At the head of the gulf of *Panama* the iſthmus of *Darien* is contracted to its narroweſt extent, there being no more than a few leagues of country to disjoin the *Atlantic* and the *Pacific* oceans. Should ſome violent convulſive ſhock of nature at any time overwhelm this narrow boundary, and, by precipitating it into the abyſs, divide the two *American* continents, and unite the two vaſt oceans, the commercial intercourſe between the diſtant parts of the globe would be facilitated much beyond what the diſcovery of a northern paſſage to the *Eaſt Indies* could poſſibly have effected. Indeed it ſeems highly probable that the labour of man could accompliſh ſuch a purpoſe, by forming an artificial channel, of ſufficient width to admit the largeſt ſhips, but the ſupineneſs of the *Spaniards*, as well as their particular intereſts, will ever cauſe ſuch a ſtupendous work to remain unattempted, ſo long as the territory is held by that nation. If, in the revolutions of human affairs, the United States of *America* ſhould become poſſeſſed of the iſthmus of *Darien*, ſuch a junction of the oceans might poſſibly be effected: at any rate they would then certainly accompliſh what the enterpriſing ſpirit and enlarged commercial views of *Paterſon*, the Scotch projector, led him to attempt in the year 1695. The deſign was to eſtabliſh a ſettlement on the N. W. point of the gulf of *Darien*, where the country had never been occupied by the *Spaniards*, but continued to be poſſeſſed by ſome tribes of *Indians*. The contriver and conductor of this undertaking obtained from king *William* a charter for the purpoſe of founding a colony, and 300,000*l.* was ſubſcribed in *Scotland*, a like ſum in *England*, and 200,000*l.* at *Hamburgh*. The views of this company were to render their ſettlement the centre of the trade to the Eaſt, by opening a ſhorter and eaſier intercourſe with *China*, *Bengal*, and every part of *India*, at the ſame time that they expected to carry on a very lucrative trade with the *Spaniſh* ſettlements, the *Weſt India* iſlands, and the *Britiſh Colonies* in *North America*. Five ſhips were fitted out, on board of which about 1200 ſettlers embarked, among whom were men of great bravery, ſpirit, and capacity, whom the peace of *Ryſwick* had thrown out of employment. The ſpot which they choſe for their new colony had the benefit of a ſafe and capacious harbour; here they erected a fort, which they called *St. Andrew*, and proceeded to build a town which was to bear the name of *New Edinburgh*; the country which they meant to occupy was called *Caledonia*: other ſhips arrived afterward, with near 2000 more adventurers. However, before this aſpiring company had eſtabliſhed itſelf, a general alarm was ſpread among the maritime powers of *Europe*; the court of *Spain* remonſtrated with the *Engliſh* miniſtry againſt ſuch intruders being permitted to occupy a country to which that kingdom claimed an excluſive right, and repreſented ſuch a ſettlement as expoſing all the rich poſſeſſions of *Spain*, in the new world, and the trade carried on there, to continual dangers: the *Dutch* were no leſs alarmed for their *Aſiatic* commerce, and the *Engliſh Eaſt India* company was equally apprehenſive: the *French* too were jealous of the interference it would have with their commercial intereſts in the *Weſt India Iſlands*. It appears, indeed, that had this ſettlement been formed, it would have become ſuch an emporium as had never before been known, and would have ruined all the eſtabliſhed commercial bodies in *Europe* as effectually as the diſcovery of a paſſage to the eaſt by the *Cape* of *Good Hope* had formerly ruined the *Venetians*; the moſt active and effectual meaſures were therefore taken by the government in *England* to ſuppreſs it: the *American* colonies, and the iſland of *Jamaica*, were ſtrictly prohibited from furniſhing the new ſettlement with proviſions, or any kinds of neceſſaries; and ſevere penalties were laid on every one who carried on any correſpondence with it. The channels whence ſubſiſtence had been procured being thus entirely obſtructed, the towering ambition which had ſwelled the breaſts of theſe adventurers was repreſſed, by the ſolicitude to provide for the exigencies of exiſtence, and the colony was preſently abandoned. The miniſters of king *William*, who adviſed their maſter to grant ſuch a charter, certainly diſcovered a great deficiency of knowledge, but it does not appear that any attempt was made to revoke the grant, although every method was taken to render it of no effect; and as the preſumption of the adventurers was at leaſt equal to the indiſcretion of the government, nothing elſe could be expected than that the colony ſhould be left to draw ſubſiſtence from its own reſources. After the union, the *Britiſh* houſe of Commons voted Mr. *Paterſon* ſomething more than eighteen thouſand pounds.

CARTHAGENA.

THE government of *Carthagena* has the river of *Santa Martha* on the E. which parts it from the province of that name; it has *Popayan* on the S. the river and *Gulf of Darien* on the W. and the *Atlantic Ocean* on the N. W. and N.

The country conſiſts of hills and vallies, covered with thick foreſts and groves. It is impoſſible to view without admiration the rich and perpetual verdure of the woods and plants which grow ſpontaneouſly: but of theſe advantages the natives make little uſe, their innate ſloth and indolence not allowing them to improve the gifts of nature, which are here dealt out to them with a laviſh hand.

Though the ſoil of *Carthagena* is not favourable to the growth of *European* vegetables, yet it produces others which the inhabitants eat with pleaſure: and though *Europeans* at firſt have a diſtaſte to the ordinary food of the country, they ſoon become well reconciled to it. Thus, though the conſtant moiſture and heat of this climate will not admit of the cultivation of wheat, barley, and other *European* grain, it produces excellent *maize* and *rice*, each in ſuch abundance, that a buſhel of maize uſually produces an hundred. From this grain they make the *bollo*, or bread uſed in this country; and alſo uſe it in feeding hogs and fattening poultry. The method of making it is to ſoak the maize, and afterward bruiſe it between two ſtones; it is then put into large bins filled with water, where, by rubbing and ſhifting it from one veſſel to another, they clear it from its huſk, and afterward grind it into a paſte, and wrapping it up in plantain-leaves boil it in water, and uſe it as bread; but in the ſpace of twenty-four hours it becomes tough, and has a diſagreeable taſte. In families of diſtinction the bollo is kneaded with milk, which greatly improves it. They alſo make of the flour of maize ſeveral kinds of paſtry, and a variety of foods equally palatable and wholeſome. They have likewiſe caſſava-bread, which is the common food of the negroes.

Wheat bread is not uncommon at the city of *Carthagena*; but as the flour comes from *Spain*, it is too dear for the common people, and is only uſed by the *Europeans* ſettled at *Carthagena* and a few *Creoles*, and by theſe only with their chocolate and conſerves. At all other meals they are habituated to prefer bollo to wheat-bread.

In this country the interwoven branches of the trees form a ſhelter impenetrable both to heat and light. The trees are not only large and lofty, but of an admirable variety, and entirely different from thoſe of *Europe*. The principal of theſe for dimenſions, are the *acajau*, the *cedar*, the *maria*, and the *balſam-tree*. Of the firſt are made the veſſels uſed for fiſhing, and for the coaſt and river-trade within the juriſdiction of this government; the wood of which is compact, fragrant, and beautiful. The cedar is of two kinds, white and reddiſh; but the laſt is moſt eſteemed. The maria and the balſam-tree, beſide the uſefulneſs of their timber, diſtil thoſe admirable balſams called maria-oil, and balſam of *Tolu*, ſo called from a village, in the neighbourhood of which it is found in the greateſt plenty, and of a peculiar excellence.

Beſide theſe trees here are alſo the *tamarind*, the *medlar*, the *ſapote*, the *papah*, the *caſſia*, the *palm*, and the *manchineel*. The palm-trees, riſing with their tufted heads above the branches of the others, form a grand perſpective on the mountains: theſe are of ſeveral kinds, and palm-wine is extracted from them all, by boring a hole in the trunk, in which is placed a tap, with a veſſel under it to receive the liquor. *Guaiacum* and *ebony*-trees are equally common, and their hardneſs nearly approaches to that of iron.

Here are alſo many cotton-trees, ſome planted and cultivated, others ſpontaneouſly produced. The cotton of both is ſpun and made into ſeveral ſorts of ſtuffs, which are worn by the negroes and the country *Indians*.

The *cacao-tree* alſo grows in great plenty on the banks of the river *Magdalena*, and in other ſituations, which the tree delights in; but thoſe in the juriſdiction of *Carthagena* greatly excel thoſe which are found in other parts both in the ſize and quality of the fruit.

There are here a vaſt number of delicious fruits, ſuch as the *pine-apple*; which from its beauty, ſmell, and flavour, has obtained the denomination of "queen of fruits;" here are alſo plantations of *ſugar-canes*.

The quadrupeds and reptiles frequent the dry and deſert places, and are diſtinguiſhed by the prodigious variety of ſpots upon their ſkins; while the vivid plumage of the feathered race glows with exquiſite beauty, and the brilliant ſcales of one claſs of reptiles conceal the moſt active poiſons. The only tame animals are horned cattle and hogs, of which there are great numbers. Though the beef is not abſolutely bad, it cannot be ſaid to be palatable; for the conſtant heat of the climate renders it lean, and deprives it of ſucculency; but the pork is delicate, and exceeds any in *Europe*. There are here *wild boars*, *deer*, *rabbits*, and *tigers*; the laſt make great havock not only among the cattle, but among the human ſpecies: their ſkin is very beautiful, and ſome are as large as ſmall horſes.

Here are alſo *leopards*, *foxes*, *armadillos*, *ſquirrels*, and innumerable ſpecies of monkies, ſome remarkable for their ſize, others for their colour. The fox's artifice in defending itſelf againſt dogs or other animals, by whom it is purſued, by voiding its urine on its own tail, and ſprinkling it on them, here effectually anſwers its intention, the ſmell being ſo fœtid, that the dogs are greatly diſordered by it, by which means the fox eſcapes. Indeed the ſtench is ſo great, that it may be ſmelt a quarter of a league from the place, and very often for half an hour after. What is here called the fox is an animal little bigger than a large cat, but delicately ſhaped, and with a very fine ſkin of a cinnamon colour; the tail is not very buſhy, but the hair is ſpongy, and forms a bunch proper for this method of defence.

The birds ſeen in this hot climate are ſo very numerous, that it is impoſſible to give a full idea of the beauty and brilliancy of their various plumage; but the cries and croakings of ſome diſturb the pleaſure that would ariſe from the warblings of others. Here we ſee an inſtance of the equity obſerved by nature in diſtributing her favours, the plumage of thoſe birds being the moſt beautiful whoſe noiſe is the moſt offenſive; while, on the other hand, thoſe whoſe appearance has nothing remarkable, excel in the ſweetneſs of their notes. This is particularly evident in the *guacamayo*, the beauty and luſtre of whoſe colours are abſolutely inimitable by painting, and yet nothing can produce a more ſhrill and diſagreeable ſound.

The moſt extraordinary of all the birds ſeems to be the *tulcan*, or preacher. It is about the ſize of a common pigeon, but its legs much larger; its tail is ſhort, and its plumage of a dark colour, but ſpotted with yellow, purple, blue, and other colours. Its head is greatly diſproportioned to its body; but it would not otherwiſe be able to ſupport its bill, which is at leaſt ſix or eight inches from the root to the point: the lower mandible cloſes with the upper through the whole length, and both diminiſh inſenſibly to the end, when it ſuddenly bends, and terminates in a ſtrong ſharp point. The tongue is formed like a feather, and, as well as the inſide of its mouth, is of a deep red. The bill is variegated with all the bright colours that adorn the plumage of other birds: at the baſe, and alſo at the convexity, it is generally of a light yellow, forming a kind of ribbon, half an inch in breadth. The reſt is of a fine deep purple, except two ſtreaks near the root, which are of a rich ſcarlet. This bird has obtained the name of the preacher from its cuſtom of perching on the top of a tree above his companions while they are aſleep, and making a noiſe like ill-articulated ſounds; moving its head to the right and left, in order to keep off the birds of prey from ſeizing on the others. They are eaſily rendered ſo tame as to run about the houſe, and come when called. Their uſual food is fruit; but the tame eat other things, and in general whatever is given them.

Another extraordinary bird is the *gallinazo*, which is about the ſize of a pea-hen, but the head and neck ſomewhat larger. From the crop to the baſe of the bill, inſtead of feathers, it has a wrinkled glandulous rough ſkin, covered with ſmall warts and tubercles. Its feathers are black, which is alſo the colour of the ſkin: its bill is well proportioned, ſtrong, and a little crooked. Theſe birds are ſo numerous and tame in the city of *Carthagena*, that it is not uncommon to ſee the ridges of the houſes covered with them. They are alſo of great ſervice on account of their cleaning the city from all kinds of filth, as they greedily devour any dead animal, or any other offenſive ſubſtance. They have ſo quick a ſcent, that they will ſmell a dead body at a prodigious diſtance, and never quit it till they have entirely reduced it to a ſkeleton. The multiplicity of theſe birds in ſuch hot climates is of the utmoſt conſequence, as otherwiſe the putrefaction cauſed by the exceſſive heat would render the air inſupportable to human beings. At their firſt riſing they fly heavily, but ſoon after dart out of ſight. Though their legs are ſtrong and well proportioned, they hop along on the ground in a very awkward manner. They have the toes forward turning inward, and one in the inſide turned a little backward; ſo that the feet interfering, occaſions their hopping and walking in the above manner. Each toe has long and thick claws.

Batts are very common all over this government; but *Carthagena* is infeſted with ſuch an infinite number of them, that after ſun-ſet, when they begin to fly, they may, without exaggeration, be ſaid to cover the ſtreets like clouds. They are the moſt dexterous bleeders both of men and cattle; for the inhabitants being obliged, by the exceſſive heats, to leave the windows of their chambers open, the batts enter, and if they find a perſon aſleep with the foot bare, they inſinuate their tooth into a vein with all the art of a moſt expert ſurgeon, ſucking the blood till they are ſatiated, after which it flows out of the orifice to the great danger of the perſon's life. The reaſon why the puncture is not felt, is attributed to the gentle and refreſhing agitation of the air by the batt's wings, throwing the perſon into a deeper ſleep, and thus preventing his feeling the ſlight puncture. This alſo happens to horſes, mules, and aſſes; but beaſts of a thick ſkin are not ſo much expoſed to it. This account, which is given by Don *Ulloa*, is confirmed by M. *Condamine*, who obſerves, that there are ſome batts of a monſtrous ſize; and that they have entirely deſtroyed at *Borja*, and other places, all the black cattle which miſſionaries had introduced there.

The great number of reptiles and inſects is not only an inconvenience to the inhabitants, but very dangerous. The moſt common of the ſnakes, and at the ſame time the moſt poiſonous, are the *coral-ſnakes*, the *rattle-ſnakes*, and the *willow-ſnakes*.

The *Scolopendra* or *Centipedes*, not only ſwarm in this country, but are of a monſtrous ſize, and are the more dangerous from their breeding in the houſes: they are generally a yard in length, but ſome are a yard and a quarter, their breadth about five inches. The back and ſides are covered with hard ſcales of a muſk-colour, tinged with red; but ſo articulated as not in the leaſt to impede their motion, and yet ſo ſtrong as to defend them againſt any blow. They are very nimble, and their bite, without timely application, proves mortal.

Scorpions are not leſs common, and of different kinds, as black, red, muſk-coloured, and ſome yellow.

There are here an infinite number of *butterflies*, which, though they differ in their figure, colours, and decorations, it is difficult to determine which are the moſt beautiful. The numberleſs muſkettoes are here extremly troubleſome.

The climate of *Carthagena* is exceſſively hot. From the month of May to the end of November is the ſeaſon they call winter, there being a continual ſucceſſion of thunder and tempeſts, the clouds precipitating the rain with ſuch impetuoſity, that the ſtreets of the capital have the appearance of rivers, and the country of an ocean. The inhabitants take this opportunity to fill their ciſterns, this being the only ſweet water they can procure. From the middle of December to the end of April the rains ceaſe, and the weather becomes agreeable, the heat being ſomething abated by the N. E. winds. This ſeaſon they call ſummer; beſide which there is another called the little ſummer of *St. John*, as, about the feſtival of that ſaint the rains are intermitted, and refreſhing gales begin to blow, and continue about a month.

The almoſt invariable continuance of the great heats, without any ſenſible difference between night and day, occaſions ſuch profuſe perſpiration, that the wan and livid complexion of the inhabitants would make a ſtranger apprehend that they were juſt recovered from ſome terrible diſtemper. In all their motions there is ſomething relaxed and ſluggiſh; it even affects their ſpeech, which is ſoft and ſlow, and their words generally broken: yet, notwithſtanding theſe appearances of ſickneſs and debility, they enjoy a good ſtate of health. Strangers from *Europe* generally retain their ſtrength and ruddy complexion about three or four months; but afterward they are no longer to be diſtinguiſhed by their countenances from the ſtated inhabitants.

The ſingularity of the climate is probably the cauſe of the ſingularity of ſeveral diſeaſes, which here afflict mankind: ſome of theſe attack only the *Europeans* newly landed, and others are common to the inhabitants. The firſt kind carries off a multitude of people, and extremely thins the crews of *European* ſhips, but ſeldom laſts above three or four days. This is cauſed in ſome perſons by cold, and in others by indigeſtion, the latter of which ſoon brings on the black vomit, from which very few recover. Some, when the vomit attacks them, are ſeized with ſuch a delirium, that, were they not tied down, they would tear themſelves to pieces, and expire in the midſt of the moſt terrible phrenſy.

The inhabitants throughout the whole extent of the government of *Cathagena* are very ſubject to the leproſy; and in order to prevent the ſpread of this diſtemper, there is, without the capital, an hoſpital called *San Lazaro*, in which all perſons of both ſexes labouring under this diſtemper are confined, without any diſtinction of age or rank; and if any refuſe to go, they are forcibly carried thither. But the ſpread of the diſtemper is not, however, effectually ſtopped; for the allowance being too ſmall for their ſubſiſtence, thoſe who have no other ſupport are permitted to beg in the city, and from their intercourſe with thoſe in health, the number of lepers never decreaſes. The hoſpital reſembles a little town. Every perſon at his entering it, where he is to continue during life, builds a cottage, in which he lives in the ſame manner as before in his own houſe, none going out unleſs to aſk alms. The ground on which the hoſpital ſtands is encompaſſed by a wall, and has only one gate, which is always carefully guarded. They live a long time under this diſtemper, and as it greatly increaſes the natural deſire of the ſexes, to prevent the outrages which would enſue from prohibiting the gratification of this paſſion they are allowed to marry.

The city of CARTHAGENA is ſituated in 10° 27′ N. latitude, 75° 27′ W. longitude, three hundred and twenty miles S. of *Port Royal*, in *Jamaica*, on a ſandy plain, which forms a narrow paſſage on the S. W. to a part called *Tierra Bomba*, as far as *Bocca Chica*. The fortifications both of the city and ſuburbs are conſtructed in the modern manner, and lined with free-ſtone. The garriſon, in time of peace, conſiſts of ten companies of regulars, each compoſed of about 700 regulars and the militia. The city and ſuburbs are well laid out, the ſtreets being ſtraight, broad, uniform, and well paved. The houſes are built of ſtone, except a few of brick, but chiefly conſiſt of only one ſtory above the ground-floor; however, the apartments are well contrived. All the houſes have balconies and lattices of wood, it being more durable in this climate than iron, which is ſoon corroded and deſtroyed by the moiſture and acrimonious quality of the nitrous air; whence, and the ſmoky colour of the walls, the outſide of the buildings make but an indifferent appearance. There are here a cathedral, a church dedicated to the Trinity, and a chapel of eaſe. The orders that have convents, are thoſe of *St. Francis*, in the ſuburbs, *St. Auguſtine*, *St. Dominic*, *La Merced*, that of the *Jacobines*, and the *Recollects*, a college of *Jeſuits*, now ſuppreſſed, and an hoſpital of *San Juan de Dios*. The nunneries are thoſe of *St. Clara* and *St. Tereſa*. The churches and convents are capacious, but not much ornamented within.

Carthagena, together with its ſuburbs, is equal to a city of the third rank in *Europe*. It is well peopled, but moſt of the inhabitants are deſcended from the *Indians*. The governor reſides in the city; it has alſo a biſhop, whoſe ſpiritual juriſdiction is of the ſame extent as that of the military and civil government: there is alſo a court of inquiſition. Beſide theſe tribunals, there is a ſecular magiſtracy, conſiſting of regidores, from whom every year are choſen two alcaldes, who are generally perſons of great diſtinction. There is likewiſe a treaſury, in which all the taxes and money belonging to the king are received.

The harbour is one of the beſt not only on the coaſt, but in all the known parts of the country. It extends two leagues and a half from N. to S. has a ſufficient depth of water, with good anchorage, and is ſo ſmooth that the ſhips are no more agitated than on a river. However, the many ſhallows at its entrance make the aſſiſtance of a good pilot neceſſary. The tides in this bay are very irregular, which is the caſe with almoſt the whole coaſt: it being often ſeen to flow a whole day, and afterward ebb away in four or five hours; yet the greateſt alteration obſerved in its depth is two feet, or two feet and a half. The ſea here abounds with a great variety of fiſh, and a multitude of large turtle: but it is greatly infeſted with ſharks.

In this harbour the galleons from *Spain* wait for the arrival of the *Peru* fleet at *Panama*, and on receiving advice ſail away to *Porto Bello*. It is the firſt place in *America* at which the galleons are allowed to touch, and thus it enjoys the firſt-fruits of commerce by the public ſales made there. The ſales, though not attended with the ſame formalities as thoſe of *Porto Bello*, are very conſiderable: for the traders of the inland provinces of *Quito*, *Popayan*, and *Santa Fe*, lay out great ſums for ſeveral ſorts of goods, and thoſe ſpecies of proviſions that are moſt wanted in their reſpective countries. The traders bring gold and ſilver in ſpecie, ingots, and duſt; as alſo emeralds; for beſide the ſilver mines worked at *Santa Fe*, which are very numerous, there are others, which yield the fineſt emeralds. The fair of *Carthagena* occaſions a great quantity of ſhops to be opened, and filled with all kinds of merchandize. This is a time of univerſal profit; to ſome by letting lodgings and ſhops; to others by the increaſe of their reſpective trades; and to others by the labour of their negro ſlaves, whoſe pay during this buſy time is proportionably increaſed; and it is not uncommon for ſlaves, out of their ſavings, after paying their maſters, and providing themſelves with neceſſaries, to purchaſe their freedom. The galleons are no ſooner gone than ſilence and tranquillity reſume their former reign.

The veſſels which ſucceſſively come to *Carthagena* to ſupply *New Grenada* with proviſions and merchandiſe, do not annually carry away above 219,000*l.* ſterling, although there is more than double that ſum coined in the mint of *Santa Fe*, which furniſhes the only ſpecie in circulation ſince the mint of *Popayan* was ſuppreſſed. The mines likewiſe produce great quantities of gold, which is not coined. The comparative ſmallneſs of theſe returns is owing to the large amount of gold which is clandeſtinely exported; ſmuggling being carried on from ſeveral places on the coaſt.

The inhabitants of this city may be divided into different tribes, who derive their origin from a mixture of whites, negroes, and *Indians*. The *Europeans* are not numerous. The latter, and the *Creoles* ſettled at *Carthagena*, carry on the whole trade of the place, while the other inhabitants are indigent, and compelled to have recourſe to hard labour for their ſubſiſtence. The dreſs of the whites, both men and women, differs but little from that worn in *Spain*; for perſons in high poſts have habits of the ſame form as in *Europe*, but with this difference, that they are all very light, the waiſtcoats and breeches being of fine linen, and the coat of ſome other thin ſtuff. Neckcloths are very uncommon, the neck of the ſhirt being adorned with large gold buttons, which generally hang looſe. On their heads they commonly wear a cap of fine linen, and others go entirely bare-headed. Fans are worn by the men: theſe are made of a kind of palm, in the form of a creſcent, with a ſtick of the ſame wood in the middle.

The *Spaniſh* women wear a kind of petticoat made of thin ſilk without any lining, and on their body a very thin white waiſtcoat; but even this is only worn in what they call winter, it being inſupportable in ſummer. They, however, always conceal their breaſts. When they go abroad they wear a mantelet, and on the days of precept go to the maſs at three in the morning, and return before the violent heat of the day, which begins with the dawn.

Thoſe women who are not perfectly of the white claſs, wear over the above petticoat one of taffety, of any colour they pleaſe, except black; this is pinked all over, to ſhew the petticoat worn under it. On the head is a cap of fine white linen covered with lace, in the ſhape of a mitre, well ſtarched, and terminating forward in a point. They never appear abroad without this and a mantelet on their ſhoulders. The ladies and other native whites uſe this as their undreſs: inſtead of ſhoes, they wear, both within and without doors, a ſmall kind of ſlippers. In the houſe their whole exerciſe conſiſts in ſitting in their hammocks, and ſwinging themſelves for air. In theſe they paſs the greateſt part of the day, and men as well as women often ſleep in them, without regarding the inconvenience of being unable to lie at full length.

Both ſexes poſſeſs a great deal of wit and penetration, with a genius ſuited to excel in all kinds of mechanic arts. This is particularly conſpicuous in thoſe who apply themſelves to literature, who at a tender age ſhew a judgment, which in other climates is attained only by a long ſeries of years. This happy diſpoſition continues till they are between twenty and thirty years old, after which they generally decline as faſt as they roſe; and frequently before they arrive at that age, when they ſhould begin to reap the advantage of their ſtudies, indolence checks their progreſs, and they forſake the ſciences, without producing any thing worthy a ſuperior capacity. This ſupineneſs is cauſed by the want of proper objects for exerciſing their talents; eminent attainments in the ſciences being no introduction to the lucrative dignities of the ſtate. However, there are often ſeen here perſons of extenſive talents, both in the ſpeculative and practical ſciences, who retain them in all their vigour to a very advanced age.

Charity is a virtue, in which the inhabitants of *Carthagena* remarkably excel; and did they not exert it in the moſt generous manner toward the *Europeans* who come thither to ſeek their fortune, ſuch ſtrangers would often periſh by ſickneſs and poverty.

The tables of perſons of wealth and diſtinction are ſerved with numerous delicacies; moſt of the diſhes are dreſſed in the manner of the country, yet they are no leſs agreeable to foreigners than to the natives. One of their favourite diſhes is the *agiaco*. This is compoſed of pork fried, birds of ſeveral kinds, plantains, maize, paſte, and ſeveral other things highly ſeaſoned with pimento.

The inhabitants of any figure generally make two meals a day, beſide a ſlight repaſt. Their breakfaſt is uſually compoſed of ſome fried diſh, paſtry of maize-flour, followed by chocolate. Their dinner conſiſts of a much greater variety; but at night they have only a ſlight regale of ſome ſweetmeats and chocolate. Some families indeed affect the *European* cuſtom of having regular ſuppers, though they are generally conſidered at *Carthagena* as detrimental to health.

The uſe of brandy is ſo common, that the moſt ſober people never omit drinking a glaſs of it about eleven o'clock in the morning, alleging that it ſtrengthens the ſtomach, weakened by inceſſant perſpiration, and creates an appetite. Chocolate is ſo common, that there is not a negro ſlave but conſtantly allows himſelf a regale of it after breakfaſt, and the negro women ſell an inferior kind ready made about the ſtreets, at the rate of a quarter of a real, or about five farthings a diſh. Chocolate is alſo conſtantly drank an hour after dinner. They alſo make great uſe of ſweetmeats and honey, never drinking a glaſs of water without previouſly eating ſome ſweetmeats.

The paſſion for ſmoking is no leſs univerſal: the ladies and other white women ſmoke only in their houſes; but women of other caſts, and the men in general, regard neither time nor place. This cuſtom the ladies learn from their childhood, probably from their nurſes, who are negro ſlaves; and it is ſo common among perſons of rank, that thoſe who come from *Europe* learn it, if they purpoſe to make any conſiderable ſtay in the country.

The natives are fond of balls, which in houſes of diſtinction are conducted in a very regular manner. They open with *Spaniſh* dances, and are ſucceeded by thoſe of the country, which are not without ſpirit and gracefulneſs. Theſe are accompanied with ſinging, and the parties ſeldom break up before daylight; but the balls of the populace are intermixed with indecent geſtures, and a continual round of drinking, which frequently produces quarrels.

Their burials and mournings are alſo ſomething ſingular, and in theſe they endeavour to diſplay their grandeur. If the deceaſed be a perſon of rank, his body is placed on a pompous catafalco, erected in the principal apartment of the houſe, amidſt the blaze of tapers. The corpſe lies there twenty-four hours, or longer, during which it is viſited by the acquaintance of the family, and the lower claſs of women, who come to lament over the deceaſed. Theſe women, who are generally dreſſed in black, come in the evening, or during the night, into the apartment where the corpſe lies, and throwing themſelves on their knees, riſe and extend their arms to embrace it; then in a doleful tone, mixed with horrid cries, they begin their lamentations, which always conclude with the name of the deceaſed. Afterward they begin in the ſame diſagreeable tone his hiſtory, rehearſing all his good and bad qualities, not even omitting his amours, till at length, quite ſpent, they withdraw to a corner of the apartment, where plenty of wine and brandy is provided, on which they copiouſly regale themſelves. No ſooner are theſe departed from the body, than others ſucceed, till all the women have taken their turn. The ſame is afterward repeated by the ſervants, ſlaves, and acquaintances of the family, ſo that it continues without intermiſſion during the remainder of the night. The funeral is alſo accompanied with the like noiſy lamentations; and, even after the corpſe is depoſited in the grave, the mourning is continued in the houſe for nine days; during which time the mourners never ſtir from the apartment, where they receive the compliments of condolence, and in the night are attended by their relations and intimate friends.

This city has been frequently attacked, taken and plundered. The firſt invaſion was made in 1544, ſoon after its eſtabliſhment, by certain *French* invaders, conducted by a *Corſican* pilot. In 1585 it was taken and almoſt deſtroyed by Sir *Francis Drake*, the ſcourge of the new *Spaniſh* ſettlements. *M. de Pointis* came before it in 1597 with a ſquadron of privateers, under the protection of the *French* king; and, after obliging the fort of *Bocca Chica* to ſurrender, whereby the entrance of the harbour was laid open, he landed his men, and beſieged *Fort Lazaro*, the taking of which was followed by the ſurrender of the city; but the capitulation was no ſecurity againſt the rage of avarice, which had conſigned it to pillage. This conqueſt has been attributed to a private correſpondence between the governor and *Pointis*. In 1741 it ſuſtained a long ſiege from the *Engliſh* under admiral *Vernon*; but they were obliged to retire, after they had made themſelves maſters of moſt of the forts on the harbour. This retreat was principally owing, beſides the ſtrength of the place, to the great mortality among the troops, and the diſagreements which aroſe between the admiral and general *Wentworth*, who commanded the land forces.

The fortifications which defended the entrance by *Bocca Chica* being then deſtroyed, the *Spaniards* ſhut up that paſſage, and opened a communication between *Carthagena* and the ſea, by means of an ancient canal, which they diſpoſed in ſuch a manner, that it will not be eaſy for an enemy's ſquadron to force it. This is the way by which all veſſels now enter into the harbour.

The Government of SANTA MARTHA, RIO DE LA HACHA, VENEZUELA, NEW ANDALUSIA, *and* NEW GRANADA.

THE government of *Santa Martha* is bounded on the E. by *Rio de la Hacha*, on the S. by *New Granada*, on the W. by *Carthagena*, and on the N. by the North ſea; extending about a hundred and forty miles from E. to W. and about two hundred from N. to S.

The country is extremely mountainous, and ſome of theſe mountains, eſpecially that called *Santa Martha*, is ſaid to be higher than the pike of *Teneriffe*. From hence reſult conſiderable advantages to the inhabitants, the air being cooler and more wholeſome than in ſome other parts of *America* near the equator. The air, however, is extremely ſultry by the ſea-coaſt; yet the mountains in the interior country are covered with ſnow, and the cold ſo intenſe, that while the people in one place are ſcorched with the ſun-beams, others, at only ſixty miles diſtance, are ſhivering with the rigours of the ſeaſon. It rains very much in the months of September and October, in that part of the country which lies toward the ſea-coaſt; but there is little rain in the other months, becauſe the E. and N. winds which blow there diſperſe and drive away the clouds. The vallies of this country are exceedingly fruitful, and produce many kinds of very rich fruits. The country abounds in rich gold mines, and in the mountains are found *ſapphires*, *emeralds*, *jaſper*, and *marble* moſt beautifully veined. At a league and a half's diſtance from the city of *Santa Martha* are ſalt-ponds, where very good ſalt is procured.

The city of SANTA MARTHA, which gives name to the province, is ſituated on a branch of the *Rio Grande*, near the mountains of *Santa Martha*, in 11° 30′ N. latitude, and 74° W. longitude, from *Greenwich*. Formerly the city was flouriſhing and populous, but it is much decayed ſince the *Spaniſh* fleets no longer touch there. The inhabitants amount to about three thouſand ſouls, including all degrees: it is honoured with the reſidence of the governor of the province, and is the ſee of a biſhop, ſuffragan to the metropolitan of *New Granada*. The houſes are built with canes, and covered with palmeto leaves; and ſome with pantiles. This town has frequently ſuffered by hoſtile fleets; for in 1525 it was entirely ruined by Sir *Francis Drake*, and the next year was plundered by Sir *Anthony Shirley*; in 1630 it was taken by the *Dutch*, and was afterward frequently pillaged by the Buccaneers.

On the E. ſide of the *Rio Grande*, about twenty miles from the capital, is ſeated the town of *Branca del Malambo*, a place of conſequence on account of the briſk trade carried on by the inhabitants. The merchandize of *New Granada* is brought down hither in boats, and conveyed to the bay about forty miles below the town, or elſe directly to *Santa Martha*, by a branch of the *Rio Grande*.

On the northern frontier of *Santa Martha* is ſeated the little province of RIO DE LA HACHA, in the form of a peninſula, between the gulf of *Venezuela* on the E. and a bay of the North ſea on the W. In the middle of the province are ſome mines of *jaſper* and *chalcedony*, and on the coaſt a very rich *pearl-fiſhery*, in which the *Indians* are principally employed, and, notwithſtanding the vigilance of the *Spaniards*, reap the chief profits. The inhabitants of the open country ſtill retain their liberty, and form a numerous, reſolute, and brave nation.

RIO DE LA HACHA, the capital, which gives name to the province, and takes its name from the river, at the mouth of which it is ſituated, was formerly called *Neuſtra Senora de los Remedios*; it ſtands about a hundred and twenty miles from the city of *Santa Martha*, and contains only about a hundred houſes. The town was formerly rich, but it was ſo often taken by the Buccaneers, that in 1682 the *Spaniards* abandoned it; they afterward returned and defended it by building ſtrong fortifications.

VENEZUELA, the next province, is bounded on the E. by *New Andaluſia*, on the S. by *New Granada*, on the W. by *Rio de la Hacha*, and on the N. by the North ſea, and includes the diſtrict of *Caraccas*; extending, according to ſome authors, four hundred miles along the coaſt of the North ſea, and near three hundred miles into the interior country. The climate is moderately temperate, and the ſoil ſo rich and fertile as to produce two harveſts every year, and to feed great herds of black cattle and flocks of ſheep. The famous lake of *Maracaibo*, which is eighty leagues in compaſs, adds equally to the beauty and convenience of the province: but though the water of the lake and rivulets which flow from it are drank, yet they are brackiſh and unwholeſome, and the natives are in great want of freſh water. The inhabitants of this province are ſaid to exceed a hundred thouſand, including *Spaniards*, mulattoes, and negroes.

VENEZUELA, or CORA, the capital of the province, is ſeated on the N. E. part of the peninſula, on the banks of the North ſea. Its ſituation in the midſt of the waters has cauſed it to be called *Venezuela*, or *Little Venice*.

The town of MARACABO, though inferior in dignity to the former, is more elegant, pleaſant, and wealthy. It fronts the lake of the ſame name, and has a great number of ſplendid edifices. The inhabitants are reckoned to exceed four thouſand, eight hundred of whom are ſaid to be capable of bearing arms. *Maracaibo* is a celebrated port for ſhip-building, for which it is very conveniently ſituated.

The county of CARACCAS extends as far as *Cape Blanco*; but the coaſt is rocky and mountainous. A very extenſive illicit trade is carried on from this coaſt with the *Engliſh* and *Dutch*, notwithſtanding all the vigilance of the *Spaniards*, who have ſcouts perpetually employed, and breaſt-works raiſed in all the vallies.

NEW ANDALUSIA is conſidered as an extenſive province, although the boundaries are not exactly known. However it has a part of *Guiana* and *New Granada* on the S. alſo part of *New Granada* and *Venezuela* on the W. the North ſea on the N. and the river *Oroonoko* on the E. including the diſtricts of *Camania* and *Paria*. The produce of the country chiefly conſiſts in *ſugar*, *tobacco*, *medicinal roots*, *gums*, dying *drugs*, *braſil* wood, and ſome valuable *timber*. To theſe may be added *pearls*, for which the *Spaniards* fiſh along the coaſt.

CUMANA, or COMANA, is the capital of *New Andaluſia*. It was built by the *Spaniards* in the year 1520, and is defended by a ſtrong caſtle, capable of making a vigorous defence, as appeared in the year 1670, when it was aſſaulted by the *Buccaneers*, who were repulſed with great ſlaughter.

NEW GRANADA, ſometimes called *Santa Fe*, and *Caſtella del Oro*, is bounded on the N. by *Santa Martha*, *Rio de la Hacha*, and *Venezuela:* on the E. alſo by *Venezuela*; on the S. by *Peru*; and on the W. by *Popayan*. The whole country is ſuppoſed to include a ſpace of three hundred and thirty-ſix miles in length, and near as much in breadth.

Though it lies between 1° and 9° of N. latitude, the climate is remarkably temperate; ſo that ſeveral writers affirm, that their equality of day and night is undiſturbed by any variety of ſeaſons; but this does not appear to be ſtrictly true, there being in reality two ſummers and two winters. The country is beautifully variegated with hills and vallies covered with verdure. The mountains contain *gold*, *ſilver*, and *emeralds*; and the vallies are enriched with all the neceſſaries of life: they produce likewiſe great quantities of *guiacum*, *gums*, *balms*, *drugs* of various kinds, and other valuable articles of commerce.

The capital of the kingdom, as it is called, is the city of SANTA FE DE BOGATA, ſeated on the bank of the lake *Gatavita*. It is the reſidence of the royal audience, and of an archbiſhop, who has for his ſuffragans the biſhops of *Carthagena*, *Santa Martha*, and *Popayan*. The city is large, populous, opulent, well built, and adorned with magnificent palaces and fine houſes.

The Government of POPAYAN.

WE now come to the government of POPAYAN, which is bounded on the N. by the government of *Carthagena*; on the E. by the kingdom of *New Granada*; on the S. by *Peru*; and on the W. its ancient boundary was the Pacific ocean: but it has ſince been contracted by the new government of *Choco*; ſo that only a part of it extends to that ſea. It is ſuppoſed to be from E. to W. about eighty leagues, and little leſs from N. to S. This government is divided into two juriſdictions, of which that on the N. and E. belong to *Santa Fe*, or *New Granada*, while all thoſe parts which lie toward the S. and W. are reckoned in the province of *Quito*.

The climate varies according to the ſituation of places, ſome being more cold than hot, others the reverſe, and ſome throughout the whole year enjoy a continual ſpring, particularly *Popayan* the capital. The ſame may be ſaid of the ſoil, which produces in great abundance the corn and fruit proper to its ſituation, and the farmers breed great numbers of horned cattle and ſheep. The diſtrict of *Popayan* is, however, ſubject to dreadful tempeſts of thunder and lightning, as well as to deſtructive earthquakes.

Among the plants of the country of *Popayan* grows the *cuca*, an herb ſo eſteemed by the *Indians* in ſome provinces of *Peru*, that they would part with any kind of proviſions, the moſt valuable metals, gems, or any thing elſe, rather than be deſtitute of it. It grows on a weak ſtem, which for ſupport twiſts itſelf round another ſtronger vegetable: its leaf is about an inch and a half, or two inches in length, and extremely ſmooth. The *Indians* make uſe of it for chewing, mixing it with a kind of chalk or whitiſh earth, called *mambi*. They put into their mouth a few leaves of *cuca*, and a proper quantity of *mambi*, and chewing them together, at firſt ſpit out the ſaliva, but afterward ſwallow it; moving it from one ſide of the mouth to the other, till its ſubſtance is quite drained, when it is diſcharged and immediately replaced by freſh leaves. This herb is ſo nutritive and invigorating, that the Indians labour whole days without any other nutriment, and loſe their ſtrength when not ſupplied with it. It alſo preſerves the teeth ſound, and fortifies the ſtomach. Great quantities of this herb are cultivated by the *Indians* in the ſouthern provinces of *Peru*, and it makes no ſmall article of trade; a vaſt deal of it is in particular carried to the mine towns, that the owners of the mines may furniſh the *Indians* with it, who otherwiſe could not be brought to work, or would not have ſtrength to go through it. This plant is the ſame with the *betel* of the *Eaſt-Indies*, and it is uſed there in the ſame manner; as has been particularly mentioned.

In the moſt ſouthern diſtricts of *Popayan* are certain trees which yield a reſin called *mopa-mopa*, of which is made a varniſh, that is not only exquiſitely beautiful, but will bear boiling water, and even acids. It has all the luſtre of the *Chineſe* lac; but with this ſuperior quality, that it never wears off nor becomes moiſt. The cabinets, tables, and other furniture made by the *Indians* of this country, are carried to *Quito*, where they are highly valued.

In the vallies of *Neyba*, and others within this juriſdiction, is an inſect extremely remarkable for the venom it contains. Its common name is *coya* or *coyba*. It is ſhaped like a ſpider; but is much leſs than a bug. Its colour is of a fiery red, and, like the ſpider, is generally found in the corners of walls and among the herbage. Its venom is ſo extremely malignant, that on ſqueezing the inſect, if any of its moiſture happens to fall on the ſkin, either of man or beaſt, it immediately penetrates into the fleſh, and cauſes large tumours that are ſoon ſucceeded by death. The only remedy hitherto known is, on the firſt appearance of a ſwelling, to ſinge the ſufferer all over the body with a flame of ſtraw, or with the long graſs which grows in thoſe plains. In order to this the *Indians* of that country lay hold of the patient, ſome by the feet and others by the hands, and with great dexterity perform the operation. However, though this inſect is ſo very noxious, yet ſqueezing it between the palms of the hands is attended with no conſequence, the callouſneſs of thoſe parts preventing the venom reaching the blood: accordingly the *Indian* muleteers ſqueeze them between the palms of their hands to gratify the curioſity of the paſſengers; but ſhould a perſon of a delicate hand make that trial, the effect would doubtleſs be the ſame there as on any other part of the body.

The people who travel along thoſe vallies, where they are ſo much in danger from the *coyas*, are warned by the *Indians* who attend them, that if they feel any thing ſticking or crawling on their neck or face, to be careful not to ſcratch the part, nor even ſo much as lift up their hand to it, the *coya* being of ſo delicate a texture, that it burſts upon the ſlighteſt touch: and as there is no danger while they do not eject the humour which they contain, the perſon acquaints ſome of the company with what he feels, and points to the place, where if it be a *coya* the other blows it away. The beaſts who are incapable of ſuch warning, are by inſtinct taught a precaution againſt the danger; for before they offer to touch the herbage with their lips, they blow on it with all their force, in order to diſperſe theſe pernicious vermin; and when their ſmell acquaints them that they are near a neſt of *coyas*, they immediately ſpring backward, and remove elſewhere. Thus they ſecure themſelves from the venom of theſe inſects, though ſometimes a mule, after all his blowing, has been known to take in ſome with his paſture, the conſequence of which is, that, after ſwelling to a frightful degree, the animal expires on the ſpot.

Every part of the juriſdiction of *Popayan* abounds in mines of gold, great numbers of which are ſtill worked, and new mines are ſtill diſcovered. In the gold mines of theſe parts the gold is not incorporated with ſtone or other heterogeneous bodies; but is found diſperſed and mixed with the earth and gravel, as ſands are found mingled with earths of different ſpecies. Thus the whole difficulty conſiſts in ſeparating the grains of gold from the earth, which is eaſily done by running ſtreams of water.

The city of POPAYAN, one of the moſt ancient in theſe parts, ſtands in a large plain. It is ſituated in 2° 28′ N. latitude, on the E. ſide of a mountain of a middling height called *M*, from its reſembling that letter, and being covered with a variety of trees affords an agreeable proſpect. The city is of a middling ſize, with broad, ſtraight, and level ſtreets.

A little more than a league to the N. of *Popayan* runs the river *Cauca*, which is very large and deep, its current rapid, and ſubject to dangerous ſwellings in the months of June, July, and Auguſt.

SECT. III.

PERU; including *Quito*, *Lima*, and *Los Charcos*.

THE great empire of *Peru* is bounded on the N. by *Popayan* laſt deſcribed, on the E. by *Amazonia*, on the S. by *Chili*, and on the W. by the *Pacific* ocean; extending from 1° 40′ N. to 26° 10′ S. latitude, and between 56° and 81° W. longitude from *Greenwich*; being about eighteen hundred miles in length, but its greateſt breadth does not much exceed three hundred and ninety.

This country is divided into three grand diviſions. *Quito*, *Lima*, or *Los Reyes*, and *Los Charcos*. As to its climate, mines, ſoil, and produce, they differ greatly in different parts of the country.

The extenſive province of QUITO is bounded on the N. by *Popayan*, and includes a part of that government, alſo by *Santa Fe de Bogota*; on the S. by the governments of *Piura* and *Chachapoyas*; on the E. it extends over the whole government of *Maynas* and the river of the *Amazons* to the meridian, which divides the *Spaniſh* from the *Portugueſe* dominions; and on the W. it is bounded by the South ſea; extending, according to *Antonio de Ulloa*, ſix hundred leagues in length, and about two hundred in its greateſt breadth; but this greatly exceeds the computation of all other geographers. He however obſerves, that it muſt be owned a great part of thoſe vaſt dominions are either inhabited by nations of *Indians*, or have not hitherto been ſufficiently peopled by the *Spaniards*, if indeed they have been thoroughly known; and that all the parts that can properly be ſaid to be peopled, and actually ſubject to the *Spaniſh* government, are thoſe intercepted by the two Cordilleras of the *Andes*, which, in compariſon to the extent of the country, may be termed a ſtreet or lane, fifteen leagues, or ſometimes more, from E. to W.; to this muſt be added ſeveral detached governments, ſeparated by the very extenſive tracks inhabited by free *Indians*.

The climate of *Quito* differs from all others in the ſame parallel, ſince even in the centre of the torrid zone, or although under the equinoctial, the heat is not only very tolerable, but even in ſome places the cold is painful; while others enjoy all the advantages of a perpetual ſpring, the fields being conſtantly covered with verdure, and enamelled with flowers of the moſt lively colours. The mildneſs of the climate, free from the extremes of heat and cold, and the conſtant equality of the day and night, render this country, which from its ſituation might be thought to be parched by the conſtant heat of the ſun, and ſcarcely inhabitable, both pleaſant and fertile; for nature has here diſpenſed her bleſſings with ſo liberal a hand, that this country in ſeveral reſpects ſurpaſſes thoſe of the temperate zones, where the viciſſitudes of winter and ſummer, and the change from heat to cold, cauſe the extremes of both to be more ſenſibly felt. However, in different parts of the country, the air is very different; in one part are mountains of a ſtupendous height and magnitude, with their ſummits covered with ſnow. The plains are temperate, the vallies hot, and, according to the high or low ſituation of the country, are found all the variety of gradations in temperature poſſible to be conceived between the extremes of heat and cold.

QUITO, the capital, in 0° 13′ S. latitude, and 77° 50′ W. longitude, from *Greenwich*, is ſo happily ſituated, that neither heat nor cold are troubleſome, though both may be felt in its neighbourhood; and what renders this equality more delightful is, that it is conſtant throughout the whole year, the difference between the ſeaſons being ſcarce perceptible. Indeed the mornings are cool, the remainder of the day warm, and the nights of an agreeable temperature.

The winds, which are pure and ſalubrious, blow for the moſt part from N. to S. but never with any violence, though they ſometimes ſhift their quarters, but without any regard to the ſeaſon of the year. Such ſignal advantages reſulting from the climate, ſoil, and aſpect of this country, would be ſufficient to render it the moſt enviable ſpot upon earth, as it is ſuppoſed to be the moſt elevated, if, whilſt enjoying theſe delights, the inhabitants were not haraſſed by terror, and expoſed to continual danger; for here tremendous tempeſts of thunder and lightning prevail, which are ſufficient to appal the ſtouteſt heart; whilſt earthquakes frequently ſpread univerſal apprehenſions, and ſometimes bury cities in ruins.

The diſtinction of winter and ſummer conſiſts in a very minute difference; the interval between the month of September and thoſe of April, May, or June, is here called the winter ſeaſon, and the other months compoſe the ſummer. In the former ſeaſon the rain chiefly prevails, and in the latter the inhabitants frequently enjoy whole days of fine weather; but whenever the rains are diſcontinued for above a fortnight, the inhabitants are in the utmoſt conſternation, and public prayers are offered up for their return. On the other hand, when they continue a ſhort time without intermiſſion, the like fears prevail, and the churches are again crowded with ſupplicants to obtain fine weather; for a long drought produces dangerous diſeaſes, and a continual rain, without intervals of ſunſhine, deſtroys the fruits of the earth. The city of *Quito*, however, enjoys one peculiar advantage in being free from muſketoes and other troubleſome inſects, ſuch as fleas and venomous reptiles, except the *nigua*, or *pique*, which is a very ſmall inſect ſhaped like a flea, but hardly viſible to the ſight. They live among the duſt, and inſinuate themſelves into the legs, the ſoles of the feet, or toes, and pierce the ſkin with ſuch ſubtlety as cannot be guarded againſt, till they have made their way through, and taken up their lodging between that and the membrane of the fleſh, where, ſucking the blood, they form a nidus covered with a white and fine tegument, reſembling a flat pearl. Here the inſect depoſits its eggs, and as the number of theſe increaſes, the nidus enlarges. There is an abſolute neceſſity for extracting it, as otherwiſe it would burſt, and thus ſcatter an infinite number of ſmall nits, which becoming niguas, would in a manner undermine the whole foot. Theſe cauſe extreme pain, eſpecially during the operation of extracting them; for ſometimes they penetrate even to the bone.

The fertility of the ſoil here is incredible, for the fruits and beauties of the ſeveral ſeaſons are viſible at the ſame time; and the curious *European* obſerves with a pleaſing admiration, that while ſome herbs of the field are fading, others of the ſame kind are ſpringing up; while ſome flowers loſe their beauty, others blow to continue the enamelled proſpect: thus, when the fruits of the trees have attained their maturity, and the leaves begin to change their colour, freſh leaves bloſſom, and fruits are ſeen in their proper gradations in ſize and ripeneſs on the ſame tree. The ſame inceſſant fertility is conſpicuous in the corn, both reaping and ſowing being carried on at the ſame time: ſo that the declivities of the neighbouring hills exhibit all the beauties of the four ſeaſons in one aſſemblage. Though all this is generally ſeen, yet there is a ſettled time for the grand harveſt: yet ſometimes the moſt favourable ſeaſon for ſowing in one place is a month or two after that of another, though their diſtance does not exceed three or four leagues. Thus in different ſpots, and ſometimes in one and the ſame, ſowing and reaping are performed throughout the whole year, the forwardneſs or retardment naturally ariſing from the different ſituations, ſuch as, mountains, riſing grounds, plains, and vallies; and the temperature being different in each, the beſt times for performing the ſeveral operations of huſbandry muſt alſo differ.

The *chirimoya* is conſidered as one of the moſt delicious fruits in the world. Its dimenſions are various, being from one to five inches in diameter. Its figure is imperfectly round, flatted toward the ſtalk, where it forms a kind of navel; but all the other parts are nearly circular. It is covered with a thin ſoft ſhell, which adheres ſo cloſely to the pulp as not to be ſeparated from it without a knife. The outward coat is green, variegated with prominent veins, forming all over it a kind of network. The pulp is white, and contains a large quantity of juice reſembling honey, of a ſweet taſte, mixed with a gentle acid of a moſt exquiſite flavour. The ſeeds are formed in ſeveral parts of the pulp, and are ſomewhat flat. The tree is high and tufted, the ſtem large and round, but with ſome inequalities full of elliptic leaves, terminating in a point. The bloſſom differs little from the colour of the leaves, which is a darkiſh green; and though far from being beautiful, is remarkable for its incomparable fragrance.

The *granadilla* in its ſhape reſembles an hen's egg, but is larger. The outſide of the ſhell is ſmooth, gloſſy, and of a faint carnation colour, and the inſide white and ſoft. The ſhell contains a viſcous liquid ſubſtance full of very ſmall and delicate grains, leſs hard than thoſe of the pomegranate. This medullary ſubſtance is ſeparated from the ſhell by a fine and tranſparent membrane. Its fruit has a delightful ſweetneſs blended with acidity, very cordial and refreſhing, and ſo wholeſome, that there is no danger of eating to exceſs.

The *frutilla*, or *Peruvian ſtrawberry*, is very different from that of *Europe* in ſize; for though they are here generally not above an inch in length, they are much larger in other parts of *Peru*; but their taſte, though juicy, and not unpalatable, is not equal to thoſe in *Europe*.

The principal courts held at *Quito* are that of the *royal audience*, which conſiſts of the preſident, who is governor of the province with regard to law affairs; four auditors, who are at the ſame time civil and criminal judges; a royal fiſcal, who, beſides the cauſes brought before the audience, takes cognizance of every thing relating to the revenue: and an officer ſtyled the protector of the *Indians*, who ſolicits for them, and when they are injured pleads in their defence.

The next is the treaſury, the chief officers of which are an accomptant, a treaſurer, and a royal fiſcal.

The tribunal of the *Croiſade*, which has a commiſſary, who is generally ſome dignitary of the church, and a treaſurer.

Here is alſo a treaſury for the effects of perſons deceaſed: an inſtitution eſtabliſhed all over the *Indies*, for receiving the goods of thoſe whoſe lawful heirs are in *Spain*, in order to ſecure them from thoſe accidents to which they might be liable in private hands.

Here is likewiſe a commiſſary of the inquiſition, with an alguazil-major and familiars, appointed by the inquiſition at *Lima*.

The corporation conſiſts of a corregidor, two ordinary alcaldes, choſen annually, and regidores. The latter ſuperintend the election of the alcaldes, which is attended with no ſmall diſturbance, the people being divided into two parties, the *Creoles* and *Europeans*.

This city is very populous, and has among its inhabitants ſome families of high rank and diſtinction, deſcended either from the original conquerors, or perſons who at different times came from *Spain* inveſted with ſome lucrative poſt. The number of great families is however but ſmall.

The commonalty may be divided into four claſſes, the *Spaniards*, *Meſtizos*, *Indians*, and *Negroes*, with their progeny: but the laſt are not ſo numerous in proportion to the reſt, as in other parts.

The *Creoles* are well made, of a proper ſtature, and of a lively and agreeable countenance. The *Meſtizos* are alſo in general well made, often taller than the ordinary ſize, very robuſt, and have an agreeable air. The *Indians*, both men and women, are commonly low of ſtature, though ſtrong and well proportioned: but more natural defects are to be found among them than in any of the reſt. Some are remarkably ſhort, ſome idiots, dumb, or blind. Their hair is generally thick and long, which they wear looſe on their ſhoulders; but the *Indian* women plait theirs behind with a ribbon, and cut that before a little above the eye-brows, from one ear to the other. The greateſt diſgrace that can be offered to an *Indian* of either ſex is to cut off their hair; for whatever corporal puniſhment their maſters think proper to inflict on them, they bear with patience; but this affront they never forgive; and accordingly the government has interpoſed, and limited this puniſhment to the moſt enormous crimes. The colour of the hair is generally a deep black: it is lank, harſh, and as coarſe as that of a horſe. On the contrary, the male *Meſtizos*, in order to diſtinguiſh themſelves from the *Indians*, cut off their hair; but the females do not adopt that cuſtom.

The country is obſerved to abound more in women than in men, which is the more remarkable, as thoſe cauſes which induce men to leave their country, as travelling, commerce, and war, naturally bring over more men from *Europe* than women. But there are many families in which there are a number of daughters, without one ſon among them. The women enjoy a better ſtate of health than the men, which may be owing in ſome meaſure to the climate, and more particularly to the early intemperance and voluptuouſneſs of the other ſex.

The whites may be conſidered as one ſixth part of the inhabitants, and the *Meſtizos*, who are the deſcendants of the *Spaniards* and *Indians*, may be reckoned a third. The next claſs is the *Indians*, who form about another third, and the others who are deſcended from theſe are about one ſixth. Theſe, according to the moſt authentic accounts, amount to between fifty and ſixty thouſand perſons of all ages, ſexes, and ranks. The *Spaniards*, as may be ſuppoſed, are the moſt eminent for riches, rank, and power; but at the ſame time many of them are among the moſt poor, miſerable, and diſtreſſed; for whatever be their wants, they diſdain to apply themſelves to any mechanic buſineſs, conſidering it as a diſgrace to that quality they ſo highly value themſelves upon, which is ſhewn in their not being black, brown, or of a copper colour. The *Meſtizos* readily apply themſelves to arts and trades; but chooſe the moſt reputable, as painting, ſculpture, and the like, in which they particularly excel. Some of them have acquired great reputation; and the works of one of theſe *Meſtizos* have been carried to *Rome*, where they were much eſteemed by the virtuoſi: what renders their execution more meritorious, is their being deſtitute of the tools which are conſidered as neceſſary to produce them; they are however, indolent and extremely unwilling to work.

The *Indians*, who are generally ſhoemakers, bricklayers, weavers, and the like, are not more induſtrious. Of theſe the moſt active and tractable are the barbers and phlebotomiſts, who equal the moſt expert profeſſors in *Europe*.

The *Spaniards*, who wear a black cloak, have under it a long coat with a cloſe ſleeve open at the ſide; and along the ſeams of the body, as well as thoſe of the ſleeves, are button-holes, and two rows of buttons for ornament. In every other particular, people of fortune affect great magnificence, wearing the fineſt clothes or ſilk ſtuffs, and very often gold and ſilver tiſſues.

The ladies of the firſt rank wear on the upper parts of their body a ſhift, on which is a looſe jacket laced; and over all a piece of baize. Every part of their dreſs appears to be covered with lace; and on days of ceremony, they wear the richeſt ſtuffs, with a profuſion of ornaments. Their hair is generally made up in treſſes, which they form into a kind of croſs on the nape of the neck, tying a rich ribbon twice round their heads, and forming the ends into a roſe at their temples. Thoſe roſes are intermixed with diamonds and flowers, and have a very pleaſing effect. When they go to church they ſometimes wear a full petticoat; but the moſt uſual dreſs on theſe occaſions is the veil.

The *Meſtizos* in general wear a blue cloth, manufactured in this country; but though they are the loweſt claſs of *Spaniards*, they are very ambitious of diſtinguiſhing themſelves from them, either by the colour or faſhion of the clothes they wear.

The *Meſtizo* women affect to dreſs in the ſame manner as the *Spaniſh*, though they cannot equal the ladies in the richneſs of their ſtuffs. The meaner ſort wear no ſhoes; but, like the men of the ſame rank, go barefooted.

The dreſs of the *Indians* conſiſts of white cotton drawers, which hang down to the calf of the leg, where they are looſe, and edged with a lace ſuitable to the ſtuff. The uſe of a ſhirt is ſupplied by a black cotton frock, made in the form of a ſack, with three openings at the bottom, one in the middle for the head, and others at the corners for the arms; thus covering their naked bodies down to the knees. Over this is a ſerge cloak, with a hole in the middle for putting the head through, and a hat made by the natives. This is their general dreſs, which they never lay aſide, even while they ſleep; and they have no additional clothing for their legs or feet. The *Indians*, who have acquired ſome fortune, particularly the barbers and phlebotomiſts, diſtinguiſh themſelves from their countrymen by the fineneſs of their drawers, and by wearing a ſhirt, which, though without ſleeves, has a lace four or five fingers in breadth, faſtened round like a kind of ruff or band. They are fond of ſilver or gold buckles to their ſhoes, though they wear no ſtockings; and inſtead of a mean ſerge cloak, wear one of fine cloth, which is often adorned with gold or ſilver lace.

There are two kinds of dreſſes worn by the *Indian* women, made in the ſame plain manner with thoſe worn by the men in general, the whole conſiſting of a ſhort petticoat and a veil of *American* baize. But the dreſs of the loweſt claſs of *Indian* women is only a bag of the ſame make and ſtuff as that of the men, which they faſten on their ſhoulders with two large pins: it reaches down to the calf of the leg, and is faſtened round the waiſt with a kind of girdle. Inſtead of a veil, they wear about the neck a piece of the ſame coarſe ſtuff, dyed black; but their arms and legs are naked.

The people have diſhes unknown in *Europe*; but are particularly fond of cheeſe; and have excellent butter in the neighbourhood of *Quito*. Sweetmeats are very much admired.

Rum is commonly drank here by perſons of all ranks, but their favourite liquor is brandy. The diſorders ariſing from the exceſſive uſe of ſpirituous liquors are chiefly ſeen among the *Meſtizos*; and the lower claſs of women, both among the *Creoles* and *Meſtizos*, are alſo extremely addicted to the ſame ſpecies of debauchery.

Another liquor much uſed in this country is *mate*, which is made of an herb, known in all theſe parts of *America* by the name of *Paraguay*, as being the produce of that country. Some of it is put into a calabaſh tipped with ſilver, called here mate, with ſugar and ſome cold water. After it has continued there ſome time, the calabaſh is filled with boiling water, and they drink the liquor through a pipe fixed in the calabaſh. It is alſo uſual to ſqueeze into the liquor a ſmall quantity of the juice of lemons or *Seville* oranges, mixed with ſome perfumes from odoriferous flowers. This is their uſual drink in the morning faſting, and many uſe it alſo at their evening regale. The manner of drinking it appears very indelicate, the whole company taking it ſucceſſively through the ſame pipe, it being carried ſeveral times round the company till all are ſatisfied. This among the *Creoles* is the higheſt enjoyment: ſo that when they travel, they never fail to carry with them a ſufficient quantity of it, and till they have taken their doſe of mate they never eat.

The vice of gaming is here carried to an extravagant height, to the ruin of many families, ſome loſing their ſtocks in trade, others the very clothes from their backs, and afterward thoſe belonging to their wives, which they hazard, ſtimulated by the hope of recovering their own.

The common people, the *Indians*, and even the domeſtics, are greatly addicted to ſtealing. The *Meſtizos*, though arrant cowards, do not want audacity in this way; for though they will not venture to attack any one in the ſtreet, it is a common practice to ſnatch off a perſon's hat, and immediately ſeek their ſafety in flight. This acquiſition is ſometimes of conſiderable value; the hats worn by perſons of rank, and even by the wealthy citizens when dreſſed, being of white beaver, worth fifteen dollars, beſide the hatband of gold or ſilver lace faſtened with a gold buckle, ſet with diamonds or emeralds. Robberies on the high-way are ſeldom heard of.

In *Quito*, and all the towns and villages of its province, different dialects are ſpoken, *Spaniſh* being no leſs common than the *Inga*, the language of the country. The *Creoles* uſe the latter as much as the former, but both are conſiderably adulterated by borrowed words and expreſſions. The firſt language generally ſpoken by children is the *Inga*; for the nurſes being *Indians*, many of them do not underſtand a word of *Spaniſh*, and thus they afterward learn a jargon compoſed of both languages.

The ſumptuous manner of performing the laſt offices for the dead, demonſtrates how far the power of habit is capable of prevailing over reaſon and prudence, for their oſtentation is ſo great in this particular, that many families of credit are ruined by prepoſterouſly endeavouring to excel others; and the people here may be ſaid to toil and ſcheme to lay up wealth, to enable their ſucceſſors to laviſh honours upon a body inſenſible of all pageantry.

The commerce of the province of *Quito* is chiefly carried on by *Europeans* ſettled here, and others who occaſionally arrive. The manufactures of this province are only cottons, ſome white and ſtriped baize, and cloths, which meet with a good market at *Lima*, for ſupplying the inward provinces of *Peru*. The returns are made partly in ſilver, and partly in fringes made of gold and ſilver thread, and wine, brandy, oil, copper, tin, lead, and quickſilver. On the arrival of the galleons at *Carthagena*, theſe traders reſort thither to purchaſe *European* goods, which, at their return, they conſign to their correſpondents all over the province. The coaſts of *New Spain* ſupply this province with *indigo*, of which there is a very large conſumption at the manufactures, blue being univerſally the colour which this people adopt for their apparel. They alſo import, by way of *Guayaquila*, iron and ſteel both from *Europe* and the coaſt of *Guatemala*.

The ſeveral Juriſdictions in the Province of QUITO.

THE province of *Quito* is divided into nine juriſdictions, which, beginning at the N. are *San Miguel de Ibarra*, *Otabalo*, the city of *Quito*, *Latacunga*, *Rio Bamba*, *Chimbo*, or *Guaranda*, *Guayaquil*, *Cuenca*, and *Loja*. The principal town in theſe parts is *San Miguel de Ibarra*.

Within the diſtrict of the village of *Mira*, in the firſt juriſdiction, are a great number of wild aſſes, which increaſe very faſt, and are not eaſily caught. The owners of the grounds where they breed permit all perſons, on paying a ſmall acknowledgment, to take as many as they can, in proportion to the number of days they employ in the ſport. The manner in which they are caught is as follows: ſeveral perſons go on horſeback, attended by *Indians* on foot, and on their arrival at a proper place form a circle in order to drive them into ſome valley, where, riding at full ſpeed, they throw a halter, the end of which is formed into a nooſe, over their heads; for theſe creatures, on finding themſelves encloſed, make furious efforts to eſcape; and if only one forces his way through, they all follow with irreſiſtible impetuoſity: but the hunters having caught them in the nooſe, throw them down, ſecure their legs, and leave them till the hunting is over, when, in order to bring them away, they pair them with tame beaſts; but this is not eaſily performed, they being ſo fierce as often to wound the perſons who undertake to manage them. They have all the ſwiftneſs of horſes, and neither ſteep aſcents nor declivities retard them in their career; when attacked, they defend themſelves with their mouth and heels with ſuch activity, that without ſlackening their pace they often maim their purſuers: yet after carrying their firſt load their celerity leaves them, their dangerous ferocity is loſt, and they ſoon contract the ſtupid look and dulneſs peculiar to the trained part of their ſpecies. It is alſo obſervable, that they will not permit any horſe to live among them; and if any one happens to ſtray into the places where they feed, they all fall upon him, and, without ſuffering him to eſcape, bite and kick him to death. They are very troubleſome neighbours, for whenever one or two of them begin to bray, they are anſwered in the ſame vociferous manner by all within the reach of the ſound, which is greatly increaſed and prolonged by the repercuſſions of the vallies and cliffs of the mountains.

In the juriſdiction of *Loja* is produced that famous ſpecific for intermitting fevers, known by the name of *quinquina*, or *Jeſuits* bark. The tree which produces it is about ſeven yards high, and the body and branches of a proportionable thickneſs. The *Indians*, in order to take off the cortex, cut down the tree, bark it, and dry the quinquina. Though there are here large foreſts of theſe trees, there is a ſenſible diminution of them, occaſioned by the *Indians* not ſowing the ſeed, thoſe which ſhoot up ſpontaneouſly being by no means equal in number to thoſe which are cut down.

The juriſdiction of *Loja* has alſo a very great advantage from breeding the cochineal inſect, which is reckoned of equal goodneſs with that of *Oaxaca* in *New Spain*: but the inhabitants are ſo far from applying themſelves to this buſineſs ſo effectually as to ſupply the demands of trade, that they breed no more than they imagine will be ſufficient for the dyers in that and the neighbouring juriſdiction of *Cuenca*. To this elegant and laſting colour it is probably owing, that the carpets of *Loja* and the baize of *Cuenca* are preferred to all others.

The cochineal inſect we deſcribed page 731: it is bred on a plant called the *nopal* or *Indian fig tree*, in *Latin opuntia maxima*. The method of planting it is by making rows of holes about half a yard deep, and about two yards diſtant from each other. In each of theſe holes is placed one or two leaves of the nopal in a flat poſition, and then covered with earth. This leaf ſoon ſhoots up into a ſingle ſtem, which, during its growth, divides into ſeveral branches, and theſe ſucceſſively produce freſh leaves, the largeſt being near the ſtem, which is full of knots, as are alſo the branches, and from theſe the leaves have their origin. The plant ſeldom exceeds three yards in height, its bloſſom is ſmall, of a bright red, and in the ſhape of a bud, from the centre of which proceeds the fruit. When the fig is ripe the outward ſkin becomes white; but the pulp is ſo fully impregnated with a deep red, that it tinges the urine of thoſe who eat it; yet few fruits are more pleaſant or wholeſome. The cochineal was formerly imagined to be a fruit or ſeed of ſome particular plant; but it is now known to be inſects which breed and are nouriſhed on thoſe trees, where they place their eggs among the leaves. The juice of the plant, which is their ſole nouriſhment, is converted into their ſubſtance, which is thus rendered of a beautiful crimſon colour. When the inſects are at their full growth they are gathered, and put into earthen pots; where they are killed and put into bags. The *Indians* have three methods of killing them, one by fire, another by the rays of the ſun, and a third by hot water; and to theſe are owing the ſeveral gradations of the colour. The method of killing them by fire is to put them on ſhovels into an oven moderately heated, the fine quality of the cochineal depending on its not being over dried at the time of killing the inſects. However, the beſt method of deſtroying this valuable creature ſeems to be by the rays of the ſun. It is remarkable that this inſect does not, in any viſible manner, injure the plant, but extracts its nouriſhment from the moſt ſucculent juice, which it ſucks by means of its proboſcis through the fine teguments of the leaves.

BESIDE the juriſdictions we have mentioned, there are five governments in the province of *Quito*; one of which is included in part of the province of *Popayan*, already deſcribed.

The two former are ſeated on the E. ſide of the *cordillera* of the *Andes*. QUIXOS, which lies on the N. joins to the juriſdiction of *Popayan*, to the E. it extends to a river named *Aguarico*, and on the W. it reaches to a part of the *Cordilleras* of the *Andes*.

The government of MACAS is bounded on the E. by the government of *Maynas*, on the S. by that of *Bracamoros*, and on the W. by the eaſt *Cordillera* of the *Andes*.

The country is very fruitful in corn; but one of the chief employments of the country people is the culture of *tobacco*, which, being of an excellent kind, is exported in rolls all over *Peru*. *Sugar-canes* and *cotton* alſo thrive well; but the dread of the free *Indians*, who have often ravaged the country, diſcourages them from planting more than is juſt ſufficient for their own uſe, the ſame unhappy ſituation as the people of *Quixos* are placed in.

Among the infinite variety of trees in this country, one of the moſt remarkable is the *ſtorax*, the gum of which is of a moſt exquiſite fragrance, but ſcarce, the trees growing in places at ſome diſtance from the villages, and it is dangerous going to them, on account of the hatred which the free *Indians* bear to the *Spaniards*. The ſame may be ſaid with reſpect to ſome mines of *ultra marine*, from which very little is brought, on account of the danger, though the colour is remarkably fine. This territory alſo produces cinnamon trees, which ſome naturaliſts ſuppoſe to be of a ſuperior quality to thoſe of the iſle of *Ceylon*. Great quantities of *copal* are brought from *Macas*, and alſo *wild wax*; but the latter is of little value.

The government, which on the S. limits the juriſdiction of the audience of *Quito*, and follows next to *Macas*, is that of JAEN DE BRACAMOROS, whoſe inhabitants amount to about three or four thouſand, who are for the moſt part *Meſtizos*, with ſome *Indians*, and but very few *Spaniards*.

GUAYAQUIL.

GUAYAQUIL, the laſt government of *Quito*, begins at *Cape Paſſado*, in 21° S. latitude, about thirty miles to the N. of the bay of *Manta*. From this Cape it extends along the coaſt, including the iſle of *Puna*, to the town of *Machala*, on the coaſt of *Tumbez*, where it is terminated by the juriſdiction of *Piura*; from whence it runs eaſtward, and is bounded by that of *Cuenca*; then turning northward, along the weſtern ſkirts of the *Andes*, it terminates on the juriſdiction of *Bamba* and *Chimbo*; extending about ſixty leagues from N. to S. and forty or forty-five from E. to W. The whole country is one continued plain, and in winter is entirely overflowed. It is divided into ſeven lieutenancies, for each of which the corregidor appoints a lieutenant, who muſt be confirmed by the audience of *Quito*.

The *canes* which grow here are remarkable both for their length, their thickneſs, and the water contained in their tubes. Their uſual length is from twelve to ſixteen yards, and the largeſt do not exceed ſix inches in diameter. The wood or ſide of the tube is about ſix lines in thickneſs, ſo that when the cane is opened and ſpread, forms a board near a foot and a half in breadth, and of theſe houſes are built. From the time of their firſt appearance, till they attain their full perfection, many of the tubes contain a quantity of water, and what is very remarkable, at full moon they are either quite or very nearly full, and with the decreaſe of the moon the water ebbs. During the decreaſe it appears turbid, and at the full is as clear as cryſtal. The water is not found in all the joints, ſome having it, and others not, alternately. This water is conſidered as an excellent remedy for bruiſes.

The canes being cut, are left to dry, whence they acquire ſuch a degree of ſtrength, as to ſerve either for rafters, beams, flooring, or even maſts for the veſſels called *balzas*. Ships which load with cacao are alſo ceiled with them, to preſerve the timbers from the great heat of that fruit. They alſo ſerve as poles for litters, and for a vaſt number of other uſes.

The *vijahua* is a leaf generally five feet in length, and two and a half in breadth; growing wild, without any ſtem. The principal rib in the middle is near half an inch broad; but all the other parts are perfectly ſoft and ſmooth. The under-ſide is green, and the upper white, covered with a fine white viſcid down. It is commonly uſed for covering houſes; and for packing up ſalt, fiſh, and other goods, which are ſent to the mountains, as it ſecures them from rain.

The *bejucos* are a kind of woody cordage, of which there are two ſorts; one growing from the earth, and twining round the trees; the other ſtriking its root into trees, and from thence deriving its nouriſhment. Both kinds, after growing to a great height, incline again to the earth, on which they creep, till they meet with another tree, to the top of which they climb as before, and then again renew their inclination toward the earth, and thus form a labyrinth of ligatures. Some are even ſeen extended, like a cord, from the top of one tree to another. They are ſo extremely flexible, that no bending or twiſting can break them. The ſlendereſt of them are between a quarter and half an inch in diameter; but the moſt common ſize is a little above half an inch: indeed, there are others much thicker; but thoſe are of little or no uſe, on account of the hardneſs contracted in their long growth. They are chiefly uſed for laſhing, tying, or faſtening different things together; and by twiſting ſeveral of them in the manner of ropes, they make cables and hawſers for balzas and ſmall veſſels; and are found to be very durable in the water.

Here are thick foreſts of various kinds of large trees, differing in foliage, the diſpoſition of their branches, and the ſize of their trunks. In the level part of this woody extent are a great number of quadrupeds and birds, and among the latter are wild peacocks, buſtards, pheaſants, and ſome others. Theſe foreſts are alſo terribly infeſted with ſnakes. Among the monkies is one ſpecies ſo very large, that when ſtanding on its hind legs it is little leſs than ſix feet high. They are black, and in every reſpect very ugly, but are eaſily tamed.

The river *Guayaquil* abounds with fiſh of various kinds; but their increaſe is greatly hindered by the prodigious number of alligators, amphibious animals that live both in the rivers and adjacent plains, though they are ſeldom known to go far from the banks of the river. When tired with fiſhing, they leave the water to baſk themſelves in the ſun, and then appear rather like rotten wood thrown aſhore by the current than living creatures; but, upon perceiving any thing approach them, they immediately plunge into the water. They are the largeſt animals of the lizard kind; ſome of them here are of ſo monſtrous a ſize, as to exceed fifteen feet in length. The head is long, turning up at the noſe like the ſnout of a hog, and furniſhed with two rows of ſtrong-pointed teeth. During the time they lie baſking on the ſhore, they keep their huge mouths wide open till filled with muſkettoes, flies, and other inſects, when, ſuddenly ſhutting their jaws, they ſwallow their prey. They generally avoid a man. The whole body of the alligator is covered with ſcales, impenetrable to a muſket-ball, unleſs it happens to hit him in the belly, which is the only vulnerable part. This is an oviparous animal.

The female makes a large hole in the ſand near the brink of a river, and in it depoſits her eggs, which are almoſt as large as thoſe of an oſtrich, and as white as thoſe of a hen, but much more ſolid. She generally lays about a hundred, continuing in the ſame place till they are all depoſited, which is about one or two days. She not only covers them with ſand, but, the better to conceal them, rolls herſelf over them, and then returns to the water, till natural inſtinct informs her that it is time to deliver her young from their confinement. When ſhe comes to the ſpot, ſhe is followed by the male; ſhe then tears up the ſand, and begins breaking the eggs, with ſuch care, that ſcarce a ſingle one is injured, and a whole ſwarm of little alligators are ſeen crawling about. She then takes them on her neck and back, to remove them into the water; but the watchful gallinazos ſeize this opportunity to deprive her of ſome; and even the male alligator, which indeed comes for no other purpoſe, devours what he can, till the female has reached the water with the few remaining; and then all that fall from her back, and do not ſwim, ſhe herſelf eats, whence of this formidable brood, happily, no more than four or five commonly eſcape.

The *gallinazos*, a ſpecies of the vulture, which we have deſcribed in treating of *Carthagena*, contribute greatly to prevent the increaſe of the alligators, they being extremely fond of their eggs, in finding which they diſcover extraordinary addreſs. Theſe birds often make it their ſole employment to watch the females during the dry ſeaſon, when they lay their eggs, the ſides of the river not being then covered with water, concealing itſelf among the branches of a tree, where it ſilently obſerves the female alligator till ſhe has laid her eggs and retires; but ſhe is no ſooner under the water, than the gallinazo darts down on the repoſitory, and with its beak, claws, and wings, tears up the ſand, and devours the eggs, leaving only the ſhells. Theſe eggs, when freſh, are alſo eaten by the mulattoes.

The alligators are not wanting in addreſs in catching fiſh, which is their principal food: eight or ten, as it were by agreement, draw up at the mouth of a river or creek, while others go a conſiderable diſtance up the river, and chaſe the fiſh downward, by which means none of any ſize eſcape them. The alligators not being able to eat under water, on ſeizing a fiſh, raiſe their heads above the ſurface, and then devour them. After ſatisfying their appetite, they retire to reſt on the banks. When they cannot find fiſh, they betake themſelves to the meadows on the banks of the river, and devour colts and calves. This is done in the night, that they may ſurpriſe them in their ſleep; and it is obſerved, that thoſe alligators that have once taſted fleſh, become ſo fond of it, as never to feed upon fiſh but when compelled by neceſſity. There are indeed many melancholy inſtances of their devouring the human ſpecies, eſpecially children who are out of doors in the dark; and theſe voracious animals having once ſeized them in their mouths, make ſure of their prey, againſt that aſſiſtance which the cries of the victim conſtantly bring, by haſtening into the water, where they immediately drown it, and then riſing to the ſurface devour it at leiſure. Boatmen, by inconſiderately ſleeping with one of their arms or legs over the ſide of a boat, have been ſeized by theſe animals, and the whole body drawn into the water. Thoſe alligators who have once feaſted upon human fleſh are known to be the moſt dangerous, and entertain an inſatiable deſire of repeating the ſame delicious repaſt.

The inhabitants of the places where they abound are very aſſiduous to deſtroy them. Their uſual method is by a piece of hard wood, ſharpened at both ends, and baited with the lungs of ſome animal; this they faſten to a thong, the end of which is ſecured on the ſhore. The alligator, on ſeeing the lungs floating on the water, ſnaps at the bait, and both points of the wood entering his jaws, he is dragged on ſhore with his mouth wide open: he then endeavours violently to reſcue himſelf, while the *Indians* bait him, knowing that the greateſt damage he could do them would be to throw down ſuch as, for want of care or agility, do not keep out of his reach.

The city of GUAYAQUIL, is ſeated on the W. bank of the river of the ſame name, in 2° 11′ S. latitude, and 81° 11′ W. longitude from *Greenwich*. The old city is built on the ſide of a mountain, and the new at the diſtance of ſeveral hundred yards; and, for preſerving a communication between them, a bridge of timber has been conſtructed of about ſix hundred yards in length. The city is of conſiderable extent, ſtretching along the bank of the river from the lower part of the old town to the upper part of the new, near a mile and a half; but it is not of a proportionable breadth. The houſes of both towns are built of wood, and many of them covered with tiles, though the greateſt part of thoſe in the old town are only thatched with leaves. They are, however, large and handſome, and have one ſtory above the ground-floor. In the front are ſhops of all kinds, and before them are generally ſpacious porticos, which, during the rainy ſeaſon, are the only places where paſſengers can walk, the ſtreets being utterly impaſſable. Perſons of rank and fortune live in the upper apartments, and the ground floors are let to ſtrangers who come to trade, or paſs through the city with their goods.

Guayaquil contains as many inhabitants, in proportion to its extent, as any *Spaniſh* city in *America*; the continual reſort of ſtrangers greatly increaſes the number, which is computed at twenty thouſand. The inhabitants capable of bearing arms are divided into companies of militia, according to their rank and complexion, and are commanded by officers choſen by themſelves, the corregidor being commander in chief.

Though the heat is here equal to that of *Panama* or *Carthagena*, all the natives, except thoſe born from a mixture of blood, are freſh-coloured, and are eſteemed the handſomeſt people not only in the province of *Quito*, but in all *Peru*. It is remarkable that the natives, notwithſtanding the heat of the climate, are not tawny, and that though the *Spaniards* have not naturally ſo fair a complexion as the northern nations, their children born here of *Spaniſh* women are very fair; a phænomenon which has yet never been fully accounted for. To theſe advantages it muſt be added, that the inhabitants are greatly diſtinguiſhed by their elegance and politeneſs.

The commerce of *Guayaquil* may be divided into two parts, one conſiſting of the products and manufactures of its juriſdiction, and the other tranſitory; its port being the place where the goods from the provinces of *Peru* and *Terra Firma* conſigned to the mountains are landed; and, on the other hand, thoſe from the mountains deſigned for theſe provinces are brought hither, and ſhipped for their reſpective ports.

Chocolate, one of its principal products, is chiefly exported to *Panama*, *New Spain*, and *Peru*. *Timber*, which is eſteemed the ſecond article, is chiefly ſent to *Callao*. Theſe branches of trade are of great advantage to *Guayaquil*, from the prodigious quantities exported; and the trade of *ſalt* is not inferior to either, though the principal markets to which it is ſent are only the inland towns in the province of *Quito*.

The INDIANS of QUITO.

THE diſpoſition of the *Indians* in the province of *Quito* is extremely remarkable, and they appear to have no reſemblance to the people found there by thoſe who firſt diſcovered the country. They at preſent poſſeſs a tranquillity not to be diſturbed either by fortunate or unfortunate events. In their mean apparel they are as contented as a prince clothed in the moſt ſplendid robes. They ſhew the ſame diſregard to riches, and even the authority and grandeur within their reach is ſo little the object of their ambition, that to all appearances it ſeems to be the ſame to an *Indian*, whether he be created an alcalde, or obliged to perform the office of a common executioner. Among them a reciprocal eſteem is neither increaſed nor diminiſhed by ſuch circumſtances; the ſame moderation appears in their food, and they enjoy their ſimple diet with the ſame complacency as others do their well-furniſhed tables. Nothing can move them or alter their minds, it being common for them to decline a little act of ſervice, though offered a very conſiderable reward. Fear cannot ſtimulate, reſpect induce, nor puniſhment compel them. They are indeed proof againſt every attempt to rouſe them from their natural indolence, in which they ſeem to look down with contempt on the wiſeſt of mortals.

Their ſloth is ſo great, that ſcarcely any thing can induce them to work. Whatever therefore is neceſſary to be done is left to the *Indian* women, who are much more active; they ſpin and make the half ſhirts and drawers which form the only apparel of their huſbands; they cook the proviſions, grind barley, and brew the beer called chicha; while the huſband ſits ſquatting on his hams, the uſual poſture of the *Indians*, looking at his buſy wife. The only domeſtic ſervice they do, is to plow their little ſpot of land, which is ſowed by the wife. When they are once ſeated on their hams, no reward can induce them to ſtir; ſo that if a traveller has loſt his way, and happens to come to one of their cottages, they charge their wives to ſay that they are not at home. Should the paſſenger alight and enter the cottage, the *Indian* would ſtill be ſafe; for having no light but what comes through a hole in the door, he could not be diſcovered; and ſhould the ſtranger even ſee the *Indian*, neither entreaties nor rewards would prevail on him to ſtir a ſtep with him.

They are lively only in parties of pleaſure, rejoicings, entertainments, and eſpecially dancing; but in all theſe the liquor muſt circulate briſkly, and they continue drinking till they are entirely deprived both of ſenſe and motion.

It is remarkable that the *Indian* women, whether maids or married, and *Indian* young men before they are of an age to contract matrimony, are never guilty of this vice: it being a maxim among them, that drunkenneſs is the privilege of none but maſters of families, who, when they are unable to take care of themſelves, have others to take care of them.

The women preſent the chicha to their huſbands in calabaſhes, till their ſpirits are raiſed; then one plays on a pipe and tabor, while others dance. Some of the beſt voices among the *Indian* women ſing ſongs in their own language, and thoſe who do not dance, ſquat down in the uſual poſture till it comes to their turn. When tired with intemperance, they all lie down together, without regarding whether they be near the wife of another, or their own ſiſter or daughter. Theſe feſtivities ſometimes continue three or four days, till the prieſt coming among them, throws away all the chicha, and diſperſes the *Indians*, leſt they ſhould procure more.

Their funerals are likewiſe ſolemnized with exceſſive drinking. The houſe is filled with jugs of chicha, for the ſolace of the mourners and other viſitors; the latter even go out into the ſtreets, and invite all of their nation who happen to paſs by to come in and drink to the honour of the deceaſed. This ceremony laſts four or five days, and ſometimes more, ſtrong liquor being their ſupreme enjoyment.

The *Indians* in the audience of *Quito* are ſaid to act contrary to all other nations in their marriages; for they never make choice of a woman who has not been firſt enjoyed by others, which they conſider as a certain indication of her perſonal attractions. After a young man has made choice of a woman, he aſks her of her father, and having obtained his conſent, they begin to cohabit together as man and wife, and aſſiſt the father-in-law in cultivating the land. At the end of three or four months, and frequently of a year, the huſband leaves his bride or wife without any ceremony; and perhaps expoſtulates with his father-in-law for endeavouring to deceive him, by impoſing upon him his daughter, whom no body elſe had thought worthy of making a bedfellow. But if no diſguſt ariſes in the man on this account, or any other, after paſſing three or four months in this commerce, which they call amanarſe, or to habituate oneſelf, they then marry. This cuſtom is ſtill very common, though the whole body of the clergy have uſed all their endeavours to put a ſtop to it. Accordingly they always abſolve them of that ſin before they give them the nuptial benediction.

The CORDILLERAS *of the* ANDES.

WE now come to the moſt remarkable mountains and deſerts in the *Cordilleras* of the *Andes*, near the countries laſt deſcribed. It has been obſerved, that the dependencies of the juriſdictions of *Quito* are ſeated between the two *Cordilleras* of the *Andes*, and that the air is more or leſs cold, and the ground more or leſs ſteril, according to the height of the mountains. Theſe barren tracts are called deſerts; for, though all the *Cordilleras* are dry, ſome are much more ſo than others; and the continual ſnow and froſts render ſome parts of them incapable of producing a ſingle plant, and conſequently they are uninhabitable by man or beaſt.

Some of theſe mountains, which appear to have their baſes reſting on other mountains, riſe to a moſt aſtoniſhing height, and, reaching far above the clouds, are here, although in the midſt of the torrid zone, covered with perpetual ſnow. From experiments made with a barometer, on the mountain of *Cotopaxi*, it appeared that its ſummit was elevated ſix thouſand two hundred and fifty-two yards above the ſurface of the ſea, ſomething above three geographical miles, which greatly exceeds the height of any other mountain in the known world.

Cotopaxi became a volcano about the time when the *Spaniards* firſt arrived in this country. A new eruption happened in 1743, which had been for ſome days preceded by a continual interior rumbling noiſe; after which an aperture was made in its ſummit, as alſo three others near the middle of its declivity; theſe parts, when the eruption commenced, were buried under prodigious maſſes of ſnow. The ignited ſubſtances which were ejected being mingled with a conſiderable quantity of ſnow and ice, melting amidſt the flames, were carried down with ſuch amazing rapidity, that the plain from *Callo* to *Latacunga* was overflowed, and all the houſes, with their wretched inhabitants, were ſwept away in one general and inſtantaneous deſtruction. The river of *Latacunga* was the receptacle of this dreadful flood, till becoming ſwollen above its banks, the torrent rolled over the adjacent country, continuing to ſweep away houſes and cattle, and rendered the land near the town of the ſame name as the river one vaſt lake. Here, however, the inhabitants had ſufficient warning to ſave their lives by flight, and retreated to a more elevated ſpot, at ſome diſtance. During three days the volcano ejected cinders, while torrents of lava with melted ice and ſnow poured down the ſides of the mountain. The eruption continued for ſeveral days longer, accompanied with terrible roarings of the wind, ruſhing through the craters which had been opened. At length all was quiet, and neither ſmoke nor fire were to be ſeen; until, in May 1744, the flames forced a paſſage through ſeveral other parts on the ſides of the mountain; ſo that in clear nights the flames, being reflected by the tranſparent ice, exhibited a very grand and beautiful illumination. On the thirteenth of November following, it ejected ſuch prodigious quantities of fire and lava, that an inundation equal to the former ſoon enſued, and the inhabitants of the town of *Latacunga*, for ſome time, gave themſelves over for loſt.

The moſt ſouthern mountain of the *Cordilleras* is that of *Mecas*, or *Sangay*, which is of a prodigious height, and the far greateſt part of it covered with ſnow; yet from its ſummit iſſues a continual fire, attended with exploſions which are plainly heard at forty leagues diſtance. The country adjacent to this volcano is entirely barren, being covered with cinders ejected from its mouth. In this mountain riſes the river *Sangay*, which, being joined by the *Upano*, forms the *Payra*, a large river which diſcharges itſelf into the *Maranon*.

In order to convey an idea of the climate on the top of theſe mountains, we ſhall give ſome account of that which prevailed on *Pichincha*, when Don *George Juan* and Don *Antonio de Ulloa* were ſtationed there, in order, by accurate obſervations, to determine the true figure of the earth. From this a judgment may be formed of the reſt; the inclemency of the weather being in proportion to the height of the mountains.

Pichincha, though famous for its great height, is twelve hundred and ſeventy-eight yards lower than the perpendicular height of *Cotopaxi*, and was formerly a vulcano, but the mouth, or crater, on one of its ſides is now covered with ſand and calcined matter; ſo that at preſent neither ſmoke nor fire iſſue from it. Our learned authors found the cold on the top of this mountain extremely intenſe, the wind violent, and they were frequently involved in ſo thick a fog, or, in other words, a cloud, that an object at ſix or eight paces diſtance was ſcarcely diſcernible. The air grew clear, by the clouds moving nearer to the earth, and on all ſides ſurrounding the mountain to a vaſt diſtance, repreſenting the ſea with the mountain ſtanding like an iſland in the centre. When this happened, they heard the dreadful noiſe of the tempeſts that diſcharged themſelves on *Quito*, and the neighbouring country. They ſaw the lightning iſſue from the clouds, and heard the thunder roll far beneath them. While the lower parts were involved in tempeſts of thunder and rain, they enjoyed a delightful ſerenity; the wind was abated, the ſky clear, and the enlivening rays of the ſun moderated the ſeverity of the cold. But, when the clouds roſe, their thickneſs rendered reſpiration difficult: ſnow and hail fell continually, and the wind returned with all its violence; ſo that it was impoſſible entirely to overcome the fear of being, together with their hut, blown down the precipice on whoſe edge it was built, or of being buried in it by the conſtant accumulations of ice and ſnow. Their fears were likewiſe increaſed by the fall of enormous fragments of rocks. Though the ſmalleſt crevice viſible in their hut was ſtopped, the wind was ſo piercing that it penetrated through; and though the hut was ſmall, crowded with inhabitants, and had ſeveral lamps conſtantly burning, the cold was ſo great, that each individual was obliged to have a chafing-diſh of coals, and ſeveral men were conſtantly employed every morning to remove the ſnow which fell in the night. By the ſeverities of ſuch a climate their feet were ſwelled, and ſo tender that walking was attended with extreme pain, their hands covered with chilblains, and their lips ſo ſwelled and chopt that every motion in ſpeaking drew blood.

"There is in all this range of mountains, as far as I have travelled," ſays *M. Bouguer*, who was engaged in the ſame expedition with the gentlemen laſt mentioned, "a certain boundary, beyond which the ſnow never melts; this boundary, in the midſt of the torrid zone, I found to be two thouſand four hundred and thirty-four fathoms above the level of the *South-ſea*. The ſnow indeed falls much lower, but then it is liable to be melted the very ſame day; whereas above that it never melts, but ſerves to increaſe

"The gather'd winter of a thouſand years."

Before we quit this ſubject, it will be proper to mention a moſt extraordinary phænomenon, which, according to the author juſt mentioned, was viſible, almoſt every day, on the tops of theſe mountains; and though it is doubtleſs as ancient as the world, it was perhaps never before a ſubject of human obſervation. The firſt time our author obſerved it was when the company was on the top of *Pambamorea*, a mountain leſs high than *Pichincha*. A cloud, in which they were involved at break of day, diſſipating, they ſaw the riſing ſun extremely ſplendid, and the cloud paſſed on the other ſide oppoſite to the ſun, where it appeared very thin, and was about twenty yards diſtant from the place where they were ſtanding, when they ſaw in it, as in a looking-glaſs, the image of each of them; and what appeared ſtill more extraordinary, the head was adorned with a glory like what is ſeen round the heads of ſaints in pictures, each head being as it were the centre of three concentric iriſes, of very lively colours, and each with the ſame varieties as a rainbow, the red being outward; the laſt or moſt external colours of one touched the firſt of the following; and at ſome diſtance from them all was a fourth arch, entirely white. Theſe were perpendicular to the horizon; and as the perſon moved, the phænomenon moved alſo. But what was moſt remarkable, though there where ſix or ſeven perſons, each could ſee none but his own ſhadow, becauſe the cloud had an uneven ſurface

face. The diameter of the arches gradually altered with the aſcent of the ſun above the horizon, and the phænomenon itſelf, after continuing a long time, inſenſibly vaniſhed. Don *Antonio de Ulloa* gives a particular deſcription of this phænomenon, and *M. Bouguar*, after deſcribing it, ſays, "This was a kind of apotheoſis to each ſpectator; and I cannot forbear mentioning that each enjoyed a ſecret pleaſure at ſeeing himſelf adorned with all theſe crowns, without perceiving thoſe of his aſſociates. I muſt obſerve, however, that this phænomenon doth not appear unleſs the aqueous particles of the clouds are frozen."

In thoſe parts of the mountains which are not ſo high as to be ſubjected to an eternal froſt, there grows a kind of ruſh, and ſeveral other plants, with a few trees of one or two ſpecies.

Though the ſeverity of the air on theſe deſerts is ſo great, that all animals cannot live upon them, yet they afford many deer, which feed on the ſtraw or ruſhes peculiar to thoſe parts; and ſome of them are to be met with on the higheſt mountains, where the cold is intolerable to the human ſpecies. Among the ruſhes are alſo bred a great number of rabbits, and ſome foxes.

The only birds known in thoſe inclement regions are *partridges*, which are ſomething different from thoſe of *Europe*, and nearly reſemble the quail; alſo *condors* and *hummers*.

The *condor*, a bird larger and ſtronger than the eagle, reſembles in its colours and appearance the gallinazo already deſcribed, and ſometimes ſoars from the higheſt mountains ſo as to be almoſt out of ſight. From its being ſeldom ſeen in low places, a ſubtile air ſeems beſt ſuited for it; though ſome, that have been tamed when young, live in the villages and plantations. They are extremely carnivorous, and are frequently known to ſeize and fly away with lambs that feed on the heaths upon the ſides of the mountains. Our author confirms this by his own obſervation; for ſeeing on a hill, adjoining to one on which he ſtood, a flock of ſheep in great confuſion, he perceived a condor flying upward from it with a lamb in its claws. When at ſome height he dropped it; but following it took it up, and let it fall a ſecond time; and then winged its way out of ſight, to avoid the *Indians*, who, at the cry of the boys and barking of the dogs, were running toward the place.

From moſt of theſe mountains flow rivers, which when too deep to be forded, bridges are made at the moſt frequented places. Of theſe there are two kinds, beſide thoſe of ſtone, which are very few. The moſt common are of wood, and the reſt of bejucos, the plant we have deſcribed as uſed for all the purpoſes of ropes. With regard to the firſt, they chooſe a place where the river is very narrow, and has on each ſide high rocks. Theſe only conſiſt of four long beams laid over the precipice, forming a path about a yard and a half in breadth, juſt ſufficient for a man to paſs over on horſeback: and cuſtom has rendered theſe ſo familiar, that the people paſs them without any apprehenſions.

The bridges of bejucos are only uſed where the breadth of the river will not admit of beams being laid acroſs. In their conſtruction ſeveral bejucos are twiſted together, in order to form a large cable of the length required. Six of theſe are drawn from one ſide of the river to the other, two of which are conſiderably higher than the other four, and ſerve for rails. Acroſs the latter are wattled croſs ſticks of bejucos, and the whole reſembles a fiſhing-net, or *Indian* hammock, ſtretched from one ſide of the river to the other. As the meſhes of this net are very large, and the foot would be in danger of ſlipping through, they ſtrew reeds at the bottom, which ſerve for a floor. "The reader will eaſily conceive," ſays our author, "that the mere weight of this kind of baſket-machine, and much more the weight of a man paſſing over, muſt cauſe it to make a prodigious bend; and if it be conſidered that the paſſenger, when he is in the midſt of his courſe, eſpecially if there is much wind, is expoſed to wide ſwingings from ſide to ſide, to paſs ſuch a bridge, which is ſometimes more than ninety feet long, requires great intrepidity of mind; yet the *Indians* paſs over it running, though loaded with the baggage and packſaddles of the mules, and laugh to ſee the *Europeans* heſitate in venturing." Moſt of theſe bridges are only for men and women, the mules ſwimming over the rivers; for their loading being taken off, they are driven into the water near half a league above the bridge, that they may reach the oppoſite ſhore near it, they being carried ſo far by the rapidity of the ſtream.

Some rivers, inſtead of a bejuco bridge, are paſſed by means of a *tarabita*, a ſingle rope made of bejucos, or from thongs cut from the hide of an ox, and conſiſting of ſeveral thongs, about ſix or eight inches in thickneſs. This rope is extended from one ſide of the river to the other, and faſtened on each bank to ſtrong poſts. On one ſide it is faſtened to a wheel, that it may be ſtraightened or ſlackened to the degree required. From the tarabita hangs a kind of leathern hammock, capable of holding a man, ſuſpended by a clue at each end. A rope is alſo faſtened and extended to the ſides of the river, for drawing the hammock to the ſide intended, which a puſh, at its firſt ſetting off, ſends quickly to the other ſide. This not only ſerves to carry over perſons and loads, but alſo the beaſts themſelves, where the rapidity of the ſtream, and the prodigious ſtones continually carried along by it, render it impracticable for them to ſwim over.

For carrying over the mules two tarabitas are neceſſary, one for each ſide of the river, and the ropes are much thicker and ſlacker. On this rope is only one clue, which is of wood, and by this the beaſt is ſuſpended, he being ſecured with girts round the belly and neck. When this is performed the creature is ſhoved off, and preſently landed on the oppoſite ſide. Thoſe that are accuſtomed to be conveyed over in this manner never make the leaſt motion, but even come of themſelves to have the girts faſtened round them; yet it is with great difficulty they are at firſt brought to ſuffer this to be done, and when they find themſelves ſuſpended, they kick and fling during their ſhort paſſage.

The roads over ſome of theſe mountains are not the leaſt of thoſe extraordinary particulars relating to them. In many places the road is ſo narrow that the mules have ſcarce room to ſet their feet, and in others it is a continued ſeries of precipices. Beſide, theſe roads are full of holes near three quarters of a yard deep, in which the mules put their fore and hind feet, ſo that ſometimes they draw their bellies and the rider's legs along the ground. Indeed theſe holes ſerve as ſteps, without which the precipices would be impaſſable; but ſhould the beaſt happen to put his foot between two of theſe holes, or not place it right, the rider falls, and, if on the ſide of the precipice, inevitably periſhes.

The manner of deſcending ſeems ſtill more dangerous. On one ſide are frequently ſteep eminences, and on the other frightful abyſſes; and as they generally follow the direction of the mountain, the road, inſtead of being on a level, forms ſteep eminences and declivities. The mules are ſenſible of the caution requiſite in theſe deſcents, for, coming to the top of an eminence, they ſtop, and having placed their fore-feet cloſe together, place the hinder feet a little forward, as if going to lie down. Having in this attitude taken a ſurvey of the road, they ſlide down with the ſwiftneſs of a meteor. The rider has nothing to do but to keep himſelf faſt in the ſaddle, for the leaſt motion is ſufficient to diſorder the equilibrium of the mule, in which caſe they both unavoidably periſh. The addreſs of the beaſt is extremely wonderful; for in this rapid motion, when he ſeems to have loſt all government of himſelf, he follows exactly the different windings of the road, as if he had accurately ſettled in his mind the courſe he was to follow, and taken every precaution for his ſafety. But the longeſt practice of travelling theſe roads cannot entirely free the mules from an apparent dread on their arriving on the top of a ſteep declivity; for they not only attentively view the road, but tremble and ſnort at the danger. If the rider inadvertently endeavours to ſpur them on, they continue immovable; and it is really wonderful to conſider how, after having overcome the firſt emotions of their fear, they ſtretch out their fore-legs, that by preſerving a proper equilibrium they may not fall, yet make with their body that gentle inclination neceſſary to follow the ſeveral windings of the road; and afterward their addreſs in ſtopping themſelves at the end of their impetuous career.

The Audience of Lima.

THE next diviſion of *Peru* is the audience of *Lima*, which is bounded on the N. by *Quito*, on the E. by the *Cordilleras* of the *Andes*, on the S. by the audience of *Los Charcas*, and on the W. by the *Pacific Ocean*, it being about ſeven hundred and ſeventy miles in length from N. to S. but of an unequal breadth.

The climate and ſoil of this country is uncommonly various; in ſome places it is exceedingly hot, in others inſupportably cold, and in the city of *Lima*, where rain never falls, it is always temperate. The ſeaſons vary within the compaſs of a few miles, and in certain parts of the audience all the viciſſitudes of weather are experienced in twenty-four hours. It is extremely remarkable that no rains fall or rivers flow on the ſea-coaſts, though the country is refreſhed by thick fogs, and the heat abated by denſe clouds that never condenſe into ſhowers. This phænomenon has drawn the attention of many naturaliſts, without their being able ſatisfactorily to account for it.

Spring begins toward the cloſe of the year, that is about the end of November or the beginning of December, when the vapours which fill the atmoſphere during the winter ſubſide, and the ſun, to the great joy of the inhabitants, again appears, and the country then begins to revive, which, during the abſence of his rays, had continued in a ſtate of languor. This is ſucceeded by ſummer, which, though hot, from the perpendicular direction of the ſun's rays, is far from being inſupportable; the heat, which indeed would otherwiſe be exceſſive, being moderated by the ſouth winds, which always blow at this ſeaſon, though with no great force. Winter begins at the latter end of June or the beginning of July, and continues till November or December, when the ſouth winds begin to blow ſtronger, and to produce a certain degree of cold, not indeed equal to that in countries where ice and ſnow are known, but ſo keen that the light dreſſes are laid by, and cloth or other warm ſtuffs worn. During the winter the earth is covered with ſo thick a fog, as totally to intercept the rays of the ſun; and the winds, by blowing under the ſhelter of this fog, retain the particles they contracted in the frozen zone. In this ſeaſon only the vapours diſſolve into a very ſmall dew, which every where equally moiſtens the earth, by which means all the hills, which during the other parts of the year offer nothing to the ſight but rocks and waſtes, are clothed with verdure and enamelled with flowers of the moſt beautiful colours. Theſe dews never fall in ſuch quantities as to impair the roads, or incommode the traveller; a very thin ſtuff will not ſoon be wet through; but the continuance of the miſts during the whole winter, without being exhaled by the ſun, fertilizes every part of the country.

Lima is as free from tempeſts as from rain; ſo that thoſe of the inhabitants who have neither viſited the mountains, nor travelled into other parts, are abſolute ſtrangers to thunder and lightning, and are therefore extremely terrified when they firſt hear the former or ſee the latter. But it is very remarkable, that what is here entirely unknown ſhould be ſo common thirty leagues to the E. of *Lima*; it being no farther to the mountains, where violent rains and tempeſts of thunder and lightning are as frequent as at *Quito*.

But though the capital is freed from the terror of theſe tempeſts, it is ſubject to what is much more dreadful. Earthquakes happen here ſo frequently, that the inhabitants are under continual apprehenſions of being, from their ſuddenneſs and violence, buried in the ruins of their own houſes: yet theſe earthquakes, though ſo ſudden, have their preſages, one of the principal of which is a rumbling noiſe in the bowels of the earth, about a minute before the ſhocks are felt, that ſeems to pervade all the adjacent ſubterraneous part; this is followed by diſmal howlings of the dogs, who ſeem to preſage the approaching danger. The beaſts of burden paſſing the ſtreets ſtop, and by a natural inſtinct ſpread open their legs, the better to ſecure themſelves from falling. On theſe portents the terrified inhabitants fly from their houſes into the ſtreets with ſuch precipitation, that if it happens in the night they appear quite naked; the urgency of the danger at once baniſhing all ſenſe of delicacy or ſhame. Thus the ſtreets exhibit ſuch odd and ſingular figures as might afford matter of diverſion, were it poſſible to be diverted in ſo terrible a moment. This ſudden concourſe is accompanied with the cries of children waked out of their ſleep, blended with the lamentations of the women, whoſe agonizing prayers to the ſaints increaſe the common fear and confuſion. The men are alſo too much affected to refrain from giving vent to their terror; ſo that the whole city exhibits a dreadful ſcene of conſternation and horror.

The earthquakes that have happened at the capital are very numerous. The firſt ſince the eſtabliſhment of the *Spaniards* was in 1582; but the damage was much leſs conſiderable than in ſome of the ſucceeding. Six years after *Lima* was again viſited by another earthquake, ſo dreadful, that it is ſtill ſolemnly commemorated every year. In 1609 another happened which overturned many houſes. On the twenty-ſeventh of November, 1630, ſuch prodigious damage was done in the city by an earthquake, that, in acknowledgment of its not having been entirely demoliſhed, a feſtival on that day is annually celebrated. Twenty-four years after, on the third of November, the moſt ſtately edifices in the city, and a great number of houſes, were deſtroyed by an earthquake; but the inhabitants retiring, few of them periſhed. Another dreadful one happened in 1678; but one of the moſt terrible was on the 28th of October, 1687. It began at four in the morning, and deſtroyed many of the fineſt public buildings and houſes, in which a great number of the inhabitants periſhed; but this was little more than a prelude to what followed; for two hours after the ſhock returned with ſuch impetuous concuſſions, that all was laid in ruins, and the inhabitants felt themſelves happy in being only ſpectators of the general devaſtation by having ſaved their lives, though with the loſs of all their property. During this ſecond ſhock, the ſea retiring conſiderably, and then returning in mountainous waves, entirely overwhelmed *Callao*, which is at five miles diſtance from *Lima*, and all the adjacent country, together with the miſerable inhabitants. From that time ſix earthquakes have happened at *Lima* previous to that of 1746. This laſt was on the twenty-eighth of October, at half an hour after ten at night, when the concuſſions began with ſuch violence, that in little more than three minutes the greateſt part, if not all the buildings in the city, were deſtroyed, burying under their ruins thoſe inhabitants who had not made ſufficient haſte into the ſtreets and ſquares, the only places of ſafety. At length the horrible effects of the firſt ſhock ceaſed; but the tranquillity was of ſhort duration, the concuſſions ſwiftly ſucceeding each other. The fort of *Callao* alſo ſunk into ruins; but what it ſuffered from the earthquake in its building was inconſiderable, when compared to the dreadful cataſtrophe which followed; for the ſea, as is uſual on ſuch occaſions, receding to a conſiderable diſtance, returned in mountainous waves, foaming with the violence of the agitation, and ſuddenly buried *Callao* and the neighbouring country in its flood. This, however, was not entirely effected by the firſt ſwell of the waves; for the ſea retiring farther, returned ſtill with greater impetuoſity, and covered both the walls and other buildings of the place; ſo that what even had eſcaped the firſt inundation was totally overwhelmed by thoſe ſucceeding mountainous waves. Twenty-three ſhips and veſſels, great and ſmall, were then in the harbour, nineteen of which were ſunk, and the other four, among which was a frigate named *St. Fermin*, were carried by the force of the waves to a conſiderable diſtance up the country. The terrible inundation and earthquake extended to other parts on the coaſt, and ſeveral towns underwent the ſame fate as the city of *Lima*; where the number of perſons who periſhed, within two days after it began, amounted, according to the bodies found, to thirteen hundred, beſide the maimed and wounded, many of which lived only a ſhort time in great torture.

The country of *Lima* enjoys great fertility, it producing all kinds of grain and a prodigious variety of fruit; here induſtry and art ſupply that moiſture which the clouds withhold. The ancient yncas of *Peru* cauſed ſmall canals to be formed, in order to conduct the waters of the rivers to every part of the country. The *Spaniards* finding theſe uſeful works executed to their hands, had only to keep them in order, and by theſe are watered ſpacious fields of barley, large meadows, plantations, vineyards and gardens, all yielding uncommon plenty. *Lima* differs from *Quito*, where the fruits of the earth have no determined ſeaſon; for here the harveſt is gathered in, and the trees drop their leaves in the proper ſeaſon.

Beſide the orchards, fields, and gardens, with which the country is delightfully variegated, there are other parts where nature ſpontaneouſly furniſhes beautiful proſpects for the inhabitants, and plenty of excellent food for their cattle, particularly the hills of *St. Chriſtopher* and *Amancaes*, whoſe perpetual verdure, diverſified in ſpring with elegant flowers, ſeems to invite the neighbouring inhabitants to a nearer enjoyment of the beauties it preſents at a diſtance to their view. The parts in the neighbourhood of the city, to the extent of ſix or eight leagues, offer the like entertainment, and accordingly many families reſort thither for change of air and rural amuſements.

Although the ſummer here is hot, yet venomous creatures are unknown; and the ſame may be ſaid of the territory called *Valles*, though here are ſome ports, as *Tumbez* and *Piura*, where the heat is almoſt as great as that of *Guayaquil*. This ſingularity can therefore proceed from no other cauſe than the natural drought of the climate.

The viceroy of *Lima* uſually reſides in that city; his government is triennial; he enjoys all the pomp and prerogatives of royalty, and is abſolute in all affairs, whether military, civil, criminal, or relating to the revenue. Under him are officers and tribunals for executing the ſeveral departments of government, and he fills up all vacant poſts. He has a body guard of a hundred and ſixty horſe, under the command of a captain and lieutenant, all in a blue uniform richly laced with ſilver: a body of fifty halberdiers who do duty in the rooms leading to the royal audience-chamber, who have waiſtcoats of crimſon velvet, with a broad gold lace: beſide theſe there is another guard within the palace, conſiſting of a detachment from the garriſon of *Callao*. All theſe are occaſionally employed in executing the viceroy's orders, and enforcing the decrees of the tribunals, after they have received his aſſent. The viceroy, beſides aſſiſting at the courts of juſtice, and the councils relating to the finances and war, gives daily audience to all ranks of people.

This officer has an annual ſalary of ſeven thouſand one hundred and ſixty-ſeven pounds ſterling, beſide his lawful perquiſites, which amount to three times that ſum. Here is a court of inquiſition.

The inhabitants of *Lima* are compoſed of *Spaniards*, negroes, *Indians*, *Meſtizos*, and other caſts proceeding from the mixture of all three. The *Spaniſh* families are very numerous; *Lima*, according to the loweſt computation, containing ſixteen or eighteen thouſand whites. Among theſe are reckoned a third or a fourth part of the moſt diſtinguiſhed nobility of *Peru*, in which number are included no leſs than forty-five counts and marquiſſes. The number of knights belonging to the ſeveral military orders is alſo very conſiderable. Beſide theſe there are ſome gentlemen of large eſtates, but without titles; one of whom traces his deſcent from the ancient yncas of *Peru*, and to this family the kings of *Spain* have granted ſeveral diſtinguiſhed honours and privileges.

Commerce is ſo far from being conſidered as a diſgrace at *Lima*, that the greateſt fortunes have been raiſed by it; and thoſe who have not a ſufficient eſtate are here deſpiſed, if through indolence or neglect they do not engage in commercial concerns, in order to mend their circumſtances, for here a royal proclamation has removed all the prejudices of the *Spaniards* againſt trade, by wiſely declaring, that commerce in the *Indies* ſhould not exclude from nobility or the military orders.

The negroes, mulattoes, and their deſcendants, form the principal part of the inhabitants, and of theſe are moſt of the mechanics; though here the *Europeans* alſo follow ſuch employments; for gain being the univerſal paſſion, the inhabitants purſue it by means of any trade, as no one is deſpiſed here, as at *Quito*, for working at a trade which is followed by mulattoes.

The third and laſt claſs of the inhabitants are the *Indians* and *Meſtizos*, who are few in proportion to the largeneſs of the city, and the multitude of the ſecond claſs. They are chiefly employed in agriculture, in making earthen ware, and bringing all kinds of proviſions to market; the domeſtic ſervices being chiefly performed by negroes and mulattoes.

Lima is the general emporium of trade of every kind, the centre of the products and manufactures of other provinces, together with thoſe of *Europe* imported by the galleons, and the ſtaple of the whole kingdom. All the wealth of the ſouthern provinces pours into this capital, and is diſcharged into the fleet which ſails with the galleons from *Callao* to *Panama*. At the head of this commerce is the tribunal *del Conſulado*, which appoints commiſſaries to reſide in the other cities of its dependence all over *Peru*. When commodities arrive at *Lima*, the merchants remit to their correſpondents ſuch goods as have been beſpoke, reſerving the reſt in warehouſes to diſpoſe of, on their own account, to the traders who then reſort to *Lima*. The produce of the ſales in the interior country is ſent to *Lima* in bars of ſilver, and a kind of amalgama of mercury and ſilver-duſt, which is coined in the mint of the city. The remittances ſent to *Lima* during the interval between the flotillas, are expended in the manufactures of the country, great quantities of which come from the province of *Quito*, and the conſumption is very large; they being worn by all the lower claſs of people who cannot afford to purchaſe *European* ſtuffs. *Lima* has alſo its particular trade with the kingdoms both of *North* and *South America*. The moſt conſiderable commodity imported from the former is ſnuff, brought from the *Havannah* to *Mexico*, thence tranſported to *Lima*, and conveyed by the merchants of that city all over the province of *Peru*. Thoſe who deal in this merchandize never engage in any other branch of commerce, except in the ſale of perfumes, porcelain, ambergris, and muſk. From *New Spain*, *Lima* receives tar, neptha, indigo, and iron; from *Terra Firma* is imported leaf tobacco, which is greatly uſed, by putting a ſmall roll in the mouth called a limpian, both by the gentlemen and ladies, as well as by the vulgar; from *Terra Firma* are alſo imported pearls, and a few other articles. The timber uſed in building houſes, ſhips, and boats, is brought from *Guayaquil*, together with chocolate. The coaſts of *Naſca* and *Piſco* ſend to *Lima* raiſins, olives, wine, brandy, and oil; and the kingdom of *Chili* flour, wheat, dried fruits, wine, lard, leather, cordage, and ſome gold. Copper and tin are brought from *Coquimbo*; and from the mountains of *Caxamarca* and *Chacapoyas* are brought a ſort of canvas made of cotton for ſails, &c. From the ſouthern provinces are ſent *Vicuna* wool for making hats, and ſome ſtuffs of a peculiar fineneſs; and laſtly, from *Paraguay* is ſent the herb called by that name, of which there is an amazing conſumption.

CALLAO is the port of *Lima*, from which it is diſtant five miles, and extends along the ſea-coaſt on a low flat point of land. The *Spaniards* have no harbour equal to this in the *South Sea*, for beauty, ſecurity, and convenience; for the largeſt veſſels may lie with perfect ſafety in the road, the water being extremely deep, and the port ſheltered from the winds by the iſland of *St. Laurence*, which alſo breaks the ſurges rolling from the S. W. The town from the ſea makes a tolerable figure, it having ſeveral public edifices; and, beſide the churches, there are five monaſteries; though, according to ſome authors, the inhabitants do not exceed four or five hundred.

The government has expended large ſums of money in giving this important harbour all the advantages of ſtrength which art could beſtow. Hence *Callao* is conſidered in *Spain* as almoſt impregnable, though in fact both the garriſon and fortifications are very inconſiderable. The latter conſiſted of an incloſure on the land ſide, flanked by ten baſtions, and ſeveral redans and plain baſtions on the edge of the ſea, with four ſtrong batteries to command the port and road; but theſe being in a manner demoliſhed in the laſt great earthquake, they have never ſince been thoroughly repaired, the money appropriated by the government having been expended for other purpoſes, more agreeable to the viceroy of *Peru*.

A judgment may be formed of the importance of this harbour, from what has been ſaid of the commerce of *Lima*, which is chiefly carried on by this channel. Two flotas annually ſail from hence; the former about the cloſe of February, which having received the ſilver ſent from *Potoſi*, returns in March. In the beginning of May the other flota ſails for *Panama* with all the treaſures of *Potoſi*, the wealth of *Chili* brought by the *Valparaiſo* fleet, and the royal revenues and merchandize brought from the moſt diſtant parts of *Peru* and *Los Charcas*. Beſide theſe fleets, there annually ſail from this port two ſhips from *Acapulco*, freighted with gold and ſilver, and the commodities they bring back are lodged in the magazines here, and dealt out to all the ſouthern provinces of *America*.

This town and the city of *Lima* are the principal places in the archbiſhopric of that name. The audience of *Lima* is alſo divided into four biſhoprics, *Truxillo*, *Guamanga*, *Cuſco*, and *Arequipa*.

The dioceſe of *Truxillo* lies to the N. of the archiepiſcopal dioceſe of *Lima*, and, like all the others, is divided into ſeveral juriſdictions. The city of TRUXILLO is ſeated in 8° 6′ S. latitude, in a pleaſant ſituation, though in a ſandy ſoil.

In the dioceſe of *Guamanga* is a rich quickſilver mine, from which the inhabitants of a neighbouring town procure their whole ſubſiſtence; the coldneſs of the air in that place checking the growth of all kinds of grain and fruit, ſo that they are obliged to purchaſe them from their neighbours. The quikſilver mines wrought here ſupply all the ſilver mines in *Peru* with that neceſſary mineral, and, notwithſtanding the prodigious quantities already extracted, no diminution is perceived.

CUSCO is the moſt ancient city in *Peru*, it being of the ſame date with the empire of the yncas, and was founded by them as the capital of the empire. On the mountain contiguous to the N. part of the city are the ruins of a famous fort built by the yncas, whence it appears that their deſign was to incloſe the whole mountain with a prodigious wall, of ſuch conſtruction, as to render its aſcent abſolutely impracticable to an enemy, in order to prevent all approach to the city. This wall was entirely of free-ſtone, and ſtrongly built, ſome of the ſtones being of a prodigious magnitude. The city of *Caſco* is nearly equal to that of *Lima*.

In this biſhopric are ſeveral mines of gold and ſilver, that are extremely rich.

The fourth dioceſe of the audience of *Lima* is *Arequipa*, which contains the city of the ſame name, one of the largeſt in all *Peru*. It is delightfully ſeated in a plain; the houſes are well built of ſtone, and are generally lofty, commodious, finely decorated on the outſide, and neatly furniſhed within. The temperature of the air is extremely agreeable, the cold being never exceſſive, nor the heat troubleſome; ſo that the fields are always clothed with verdure, and enamelled with flowers, as in a perpetual ſpring. But theſe advantages are allayed by its being frequently expoſed to dreadful earthquakes; for by theſe convulſions of nature it has been four times laid in ruins. The city is, however, very populous, and among its inhabitants are many noble families.

In this biſhopric are ſeveral gold and ſilver mines, and in ſome parts are large vineyards, from which conſiderable quantities of wine and brandy are made. Among the other productions is *Guinea* pepper, in which the juriſdiction of *Africa* in this dioceſe carries on a very advantageous trade, the annual produce of theſe plantations bringing in no leſs than ſixty thouſand dollars *per annum*. The pods of this pepper are about a quarter of a yard in length, and, when gathered, are dried in the ſun and packed up in bags of ruſhes, each bag containing an aroba, or a quarter of a hundred weight, and thus they are exported to all parts. Other places of this juriſdiction are famous for vaſt quantities of large and excellent olives, far exceeding the fineſt produced in *Europe*, they being nearly the ſize of a hen's egg.

The Audience of LOS CHARCAS, *or* LA PLATA; *the mountain of* POTOSI, *and the city of* PLATA.

THE audience of CHARCAS, the laſt diviſion of *Peru*, is equal in extent to that of *Lima*; but many of its parts are not ſo well inhabited, ſome being full of vaſt deſerts and impenetrable foreſts, while others have extenſive plains intercepted by the ſtupendous height of the *Cordilleras*: the country is inhabited only in ſuch parts as are free from thoſe inconveniences. It is bounded on the N. by the dioceſe of *Cuſco*, and reaches ſouthward to *Buenos Ayres*; on the E. it extends to *Braſil*; and on the W. reaches to the *Pacific ocean*, particularly at *Atacama*. The remainder of the province borders on the kingdom of *Chili*.

This audience is divided into the archbiſhopric of *Plata*, and five biſhoprics. We ſhall begin with the former.

The famous mountain of *Potoſi* is known all over the commercial world for the immenſe quantity of ſilver it has produced. The diſcovery of this amazing treaſure happened at the commencement of the year 1545, by a fortuitous accident. An *Indian*, by ſome called *Hualpa*, and by others *Gualca*, purſuing ſome wild goats up this mountain, and coming to a very ſteep part, laid hold of a ſhrub in order to aſcend with greater celerity; but the ſhrub being unable to ſupport his weight, came up by the roots; diſcovering at the ſame time a maſs of fine ſilver, and ſome lumps of the ſame metal, among the clods that adhered to the roots. This *Indian*, who lived at *Porco*, haſtened home with theſe firſt-fruits of his diſcovery, waſhed the ſilver, and made uſe of it, repairing when his ſtock was nearly exhauſted to his abundant reſource. At length a friend of his, named *Guanca*, obſerving the happy change in his circumſtances, became curious to know the cauſe, and was ſo importunate in his requeſts that *Hualpa* at length revealed the ſecret to him. For ſome time they repaired in concert to the mountain and obtained abundant ſupplies, till *Hualpa* refuſing to impart his method of purifying the metal, *Guanca* revealed the important ſecret to his maſter *Villaroel*, a *Spaniard*, who alſo lived at *Porco*. On this information he went, in April 1545, to view this rich aperture in the mountain, and the mine immediately began to be worked with immenſe advantage.

The firſt mine was called the *Diſcoverer*, from its diſcovering other ſources of riches, farther removed from the ſurface: in a few days another was found equally rich, and called the *Tin Mine*: ſince that another has been diſcovered, and diſtinguiſhed by the name of *Rica*, or rich, it ſurpaſſing all the reſt. It was afterward ſucceeded by one named the *Mendieta*. Theſe are the principal mines of *Potoſi*; but there are ſeveral ſmaller veins croſſing the mountain on all ſides.

On a report of theſe important diſcoveries, people from all parts repaired to *Potoſi*, particularly from the city of *Plata*, which is ſituated about ſeventy-five miles from the mountain; ſo that at preſent the town of *Potoſi* is near ſix miles in circuit, and inhabited by many noble families, particularly thoſe concerned in the mines. Though the air of the mountain is ſo extremely cold as to render the adjacent country remarkably barren, it producing neither corn, fruit, nor herbs; yet the town is ſo plentifully ſupplied as to enjoy an abundance of every kind, and the trade for proviſions is greater here than in any other place, except *Lima*. Some provinces ſend the beſt of their corn and fruit, others their cattle, others their manufactures, and thoſe who trade in *European* goods reſort to *Potoſi* as to a market where there is a great demand, and no want of ſilver to give in exchange. A *Spaniſh* author aſſerts, from very good authority, that before the year 1638 it appeared, by the public accounts, that the produce of the ſilver amounted to three hundred ninety-five millions ſix hundred and nineteen thouſand dollars; which in ninety-three years, the time it had then been diſcovered, amounted to forty-one millions two hundred fifty-five thouſand and forty-three dollars *per annum*. Hence an idea may be formed of the vaſt trade which has for many years been carried on in this town, and is ſtill likely to continue for a long time, its whole trade conſiſting in the ſilver extracted from this mountain; and though ſome diminution has been perceived in its produce, it is ſtill very conſiderable.

At a ſmall diſtance from *Potoſi* are the hot medicinal baths, called *Don Diego*, whither ſome reſort for health, and others for diverſion.

In the province of CARANGAS, which is remarkably cold, is a great number of ſilver mines, conſtantly worked; among which, one called *Turco*, is very remarkable for a ſort of ore termed by miners *machacado*, the fibres of the ſilver forming an admirable intertexture with the ſtones in which they are contained. Mines of this kind are generally the richeſt. Beſide theſe there are others in this juriſdiction; for in the barren ſandy deſerts extending toward the coaſt of the *Pacific ocean* are found, by digging in the ſand, detached lumps of ſilver unmixed with any ore or ſtone but what adheres to ſome parts of the metal. The lumps are called papas, from their being taken out of the ground in the ſame manner as that root. Theſe lumps of ſilver are of a different compoſition from thoſe found in the mines, having all the appearance of melted ſilver. In them the ſilver forms a maſs, and the ſurface is covered over with black terrene particles, that have all the marks of calcination; but few or none of them are mixed with the ſilver. The ſize and figure of theſe lumps are very different, ſome weighing about two marks, or ſixteen ounces, and ſome above a hundred marks. Theſe lumps of ſilver are found in different parts of the ſame ground, though not often near one another.

The city of PLATA, which received its name from the ſilver mines in its neighbourhood, ſtands in a ſmall plain environed by eminences that defend it from the winds.

Two leagues from *Plata* runs the river *Cachimayo*, which has on its banks ſeveral pleaſant ſeats of the inhabitants; and about ſix leagues in the road leading to *Potoſi* is the river *Pilcomayo*, which is paſſed over by a large ſtone-bridge. During ſome months in the year this river furniſhes the city of *Plata* with great plenty of delicious fiſh: among theſe is one called the *dorado*, which generally weighs between twenty and twenty-five pounds. The other proviſions, as bread, fleſh, and fruits, are brought from the neighbouring provinces.

The dioceſes in the audience of *Plata* are, *La Paz*, *Santa Cruz*, *de la Sierra*, *Tucuman*, *Paraguay*, and *Buenos Ayres*.

WE ſhall begin with that of LA PAZ, which is divided into ſix juriſdictions. In the mountainous parts of this dioceſe are large woods of valuable *timber*, but infeſted with *tygers*, *leopards*, and *bears*: they have alſo a few *deer*, and a great number of cattle of the *European* kinds, which feed on the heaths; as do alſo *lamas*, *guanacos*, and *vicunas*.

The *lama* in ſeveral particulars reſembles the camel, as in the ſhape of its head, neck, and ſome other parts; but has no bunch on its back, and is much ſmaller, clovenfooted, and of a different colour; for though moſt of them are brown, ſome are black, others white, and others of different colours. Its pace reſembles that of a camel, and its height is equal to that of an aſs between one and two years old. The *Indians* and *Spaniards* uſe them as beaſts of burden, and they anſwer very well for any load under a hundred weight. Anciently the *Indians* uſed to eat the fleſh of this animal, as they ſtill do the fleſh of ſuch as are paſt their labour, and ſay there is no difference between it and mutton, except its being ſomething ſweeter. It is a very docile animal, eaſily kept; its whole power of defence conſiſts in ejecting from its noſtrils a viſcous matter, which is ſaid to give the itch to any one on whom it falls; ſo that the *Indians*, who firmly believe this, are very cautious in provoking it.

The *guanaco* and the *vicuna* are but little different from the lama. The *guanaco* is larger, and its wool long and harſh; the *vicuna*, which is ſmaller than the lama, has ſhorter and finer wool, and is brown all over the body, except the belly, which is whitiſh. The laſt are of great ſervice in the mines, carrying metals in ſuch rugged roads as would be impaſſable to any other beaſts.

In the *Cordilleras*, near the city, is a mountain of remarkable height, called *Illimani*, which doubtleſs contains immenſe riches; for a crag of it being ſome years ago ſevered by a flaſh of lightning, and falling on a neighbouring mountain, ſuch a quantity of gold was found in the fragments, that for ſome time that metal was ſold at *Paz* for eight pieces of eight *per* ounce; but its ſummit being perpetually covered with ice and ſnow, no mine has been opened in the mountain.

In this dioceſe is the lake of *Titicaca*, which is ſomewhat of an oval figure, and about eighty miles in circumference, and the water in ſome parts ſeventy or eighty fathoms deep. Ten or twelve large rivers, beſide a great number of ſmaller ſtreams, empty themſelves into it. The water, though neither bitter nor brackiſh, is turbid, and its taſte ſo nauſeous that it cannot be drank. This lake contains ſeveral iſlands, among which is one of a conſiderable ſize, on which the yncas erected a magnificent temple to the ſun, the walls of which were covered with plates of gold and ſilver; but this immenſe maſs of riches the *Indians*, on ſeeing the rapaciouſneſs of the *Spaniards* on their conquering the country, are ſuppoſed to have thrown into the lake, to prevent its falling into ſuch hands.

The city of *La Paz* is of a middling ſize, and from its ſituation among the breaches of the *Cordilleras*, the ground on which it ſtands is unequal, and it is alſo ſurrounded by mountains. When this river is increaſed, either by the rains, or the melting of the ſnow on the mountains, its current forces along large maſſes of rocks with ſome grains of gold, which are found after the flood has ſubſided. Hence ſome idea may be formed of the riches incloſed in the bowels of theſe mountains; a remarkable proof of which appeared in the year 1730, when an *Indian*, waſhing his feet in the river, diſcovered ſo large a lump of gold, that the marquis *de Caſtle Fuerte* gave twelve thouſand pieces of eight for it, and ſent it as a preſent to the king of *Spain*.

THE biſhopric of *Santa Cruz de la Sierra* is a government and captain-generalſhip, and though its juriſdiction is of large extent, not many *Spaniards* are found in it; and its few towns are in general miſſions comprehended under the name of miſſions of *Paraguay*.

The city of SANTA CRUZ, the capital of this government, ſtands eighty or ninety leagues E. of *Plata*, but is neither large nor well built, nor has any thing anſwerable to the name of a city. The houſes are of ſtone covered with palm-leaves.

The miſſions belonging to the *Jeſuits* in the parts dependant on this biſhopric are called *Indios Chiquitos*, or *Little Indians*, a name they received from the *Spaniards* from the extreme ſmallneſs of the doors of their houſes. Their country lies between *Santa Cruz de la Sierra*, and the lake of *Xarayes*, whence the river *Paraguay* has its riſe; and being increaſed by the conflux of others, forms the famous river of *Plata*. About the cloſe of the laſt century the *Jeſuits* began to preach to theſe *Indians*; and had ſuch ſucceſs, that in 1732 they had formed ſeven towns, each conſiſting of above ſix hundred families, and were then building others for aſſembling under their laws the great number of *Indians* they brought over to the *Romiſh* church.

The *Indios Chiquitos* are active and well made, and their courage has been frequently experienced by the *Portugueſe*, who uſed to make incurſions into their country, in order to carry off the inhabitants for ſlaves: but the valour of theſe *Indians* has compelled their enemies to keep within their own limits. The arms of the *Indians* are poiſoned arrows, muſkets, and ſabres. Though their language is different from that of the other nations of *Paraguay*, they have nearly the ſame cuſtoms. Bordering on theſe is another nation of *Indians*, who have always ſtrenuouſly refuſed to liſten to the miſſionaries.

The biſhopric or government of *Tucuman* lies in the centre of this part of *America*, beginning S. of the river *Plata*, beyond the towns of *Chicas*, which furniſh *Indians* for the mines of *Potoſi*; on the E. it borders on *Paraguay* and *Buenos Ayres*, reaching weſtward to the kingdom of *Chili*, and ſouthward to the plains of *Magellan*. The territories of this government are of ſuch extent, that they reach above two hundred leagues from N. to S. and in ſome parts little leſs than an hundred from E. to W.; but all the towns are ſmall, and built without either order or ſymmetry. The principal part of the country is not habitable, either from the want of water, or the impenetrable foreſts with which it is covered; and the *Spaniards* are prevented from extending their ſettlements by the ravages of the free *Indians*, who take all opportunities to deſtroy them.

PARAGUAY.

THE fourth biſhopric of the audience of *Charcas* is *Paraguay*, which lies to the E. of *Tucuman*, and is bounded on the N. by *Santa Cruz de la Sierra*; on the S. by the *Rio de la Plata* and *Buenos Ayres*; and on the E. by the *Portugueſe* ſettlements along the coaſt.

In 1580 the *Jeſuits* were firſt admitted into theſe fertile regions, where they afterward founded, in the reign of *Philip* III. at the commencement of the 17th century, the famous miſſions which in *Europe* go by the name of *Paraguay*, and in *America*, with more propriety, by that of *Uraguay*, from the river of that name, on which they are ſituated. They were always divided into colonies, which at firſt were weak and few, but by gradual progreſs have been increaſed to the number of thirty-ſeven, *viz.* twenty-nine to the weſtward of the *Uraguay*, and eight on the eaſtward; each of which was governed by two *Jeſuits*, who wore the habit of the order, one of whom was rector, and the other his curate. "Two motives," ſays *M. de Bougainville*, "which ſovereigns are allowed to combine, if they do not claſh, namely religion and intereſt, made the *Spaniſh* monarch deſirous of the converſion of the *Indians*: by making them catholics, they became civilized, and the *Spaniſh* monarchy became poſſeſſed of an extenſive country, enjoying every advantage of climate and of ſoil. This was opening a new ſource of wealth to the mother-country, and making proſelytes to the church." The *Jeſuits* undertook to effect theſe purpoſes, but they repreſented, that in order to accompliſh ſo difficult an enterpriſe, they ought to be made independent of the governors of the province, and that even no *Spaniards* ſhould be allowed to come into the country. They pleaded, that the vices of *Europeans* would contaminate their proſelytes, and either obſtruct or render ineffectual their converſion to Chriſtianity: they likewiſe urged, that the *Spaniſh* haughtineſs would diſguſt theſe ſimple children of nature. The force of this reaſoning was admitted by the court of *Spain*, and the miſſionaries were inveſted with an authority ſubject only to the control of the king of *Spain* and his council: they were alſo aſſiſted with 60,000 piaſtres yearly from the royal treaſury, to enable them to make ſettlements, on condition, that as the colonies ſhould be formed, and the lands be cultivated, the *Indians* ſhould annually pay a piaſtre *per* head to the king, from the age of eighteen to ſixty. It was likewiſe ſtipulated, that the miſſionaries ſhould teach the *Indians* the *Spaniſh* language; but this injunction, it ſeems, has not been complied with.

Thus powerfully ſupported, the holy fathers entered on their work with equal zeal and ſagacity. The full exertion of their talents was neceſſary, to gain an aſcendency over the minds of a ſavage and inconſtant race of men, attached to indolence and independence, and to reconcile ſuch to obedience and labour. The obſtacles were many and great; they increaſed at every ſtep. The miſſionaries learned the language of the country, and in ſome meaſure conformed to its manners; their kindneſſes and attentions at laſt brought theſe wild diſorderly inhabitants of the woods to yield a voluntary obedience. The *Jeſuits* made uſe of that reverence with which they had inſpired the *Indians*, in eſtabliſhing the moſt ſolid and real authority, a dominion over the mind. They then collected them into fixed habitations, gave them laws, introduced uſeful and polite arts among them; and of a barbarous nation, without civilized manners, and without religious principles, they made a placid and well governed people, who ſtrictly obſerved the Chriſtian ceremonies. Theſe *Indians*, charmed with the perſuaſive eloquence of their apoſtles, willingly obeyed a ſet of men, whom they were convinced would ſacrifice themſelves for their happineſs; accordingly, when they aimed at forming an idea of the king of *Spain*, they repreſented him to their imagination in the habit of the order of *St. Ignatius*.

The enlightened parts of *Europe* were agreed in pronouncing an eccleſiaſtical form of government the moſt inſupportable of tyrannies, when the conduct of theſe miſſionaries in forming their eſtabliſhment ſhewed the poſſibility of that principle being fallacious. Than this magical government, founded by ſpiritual arms alone, and maintained by the charms of perſuaſion, what inſtitution could appear more honourable to human nature! The laws eſtabliſhed by the miſſions were conſidered as inſtitutions calculated to diſtribute happineſs and wiſdom among men. Here was formed a ſociety inhabiting a fertile land, in a happy climate, of which all the members were induſtrious, without being actuated by the principles of ſelf-intereſt: the produce of all labour being faithfully conveyed into public ſtorehouſes, whence every individual was ſupplied with every neceſſary for his nouriſhment, dreſs, and houſekeeping. The man in full vigour feeds by his labour the new-born infant; and when time has conſumed his ſtrength, his fellow-citizens make him a like return of ſervices. The private houſes convenient, the public buildings magnificent; the worſhip uniform, and ſcrupulouſly attended; this happy people, knowing neither the diſtinction of rank nor of nobility, ſeemed to be equally ſheltered againſt the miſchiefs ariſing from ſuperabundance on the one hand, and want on the other.

The great diſtance, and the illuſion of perſpective, made the miſſions bear this aſpect in the eyes of all *Europe*. But the theory has ſince been found to be widely different from the execution of this plan of government. The poor *Indians*, whoſe minds were moulded to the purpoſes of their inſtructors, ſunk into a torpid ſtate of inſenſibility. If they actually endured no miſery, they were equally deprived of all enjoyment. Theſe poor wretches were clothed with a callico-ſhirt, and received an allowance of meat, maize, and caamini; but they were in return obliged to drudge for the fathers, in planting the *Paraguay* tea, cotton, tobacco, and ſugar. Every ounce of cotton and caamini raiſed by theſe ſelf-devoted ſlaves, was required to be delivered into the ſociety's ſtorehouſes, whence they were tranſported and ſold for the benefit of the miſſionaries: thoſe who concealed any of the above articles, got twelve laſhes, in honour of the twelve apoſtles, and were confined to faſting three days in the public workhouſe. *Benedict* XIV. who was advanced to the papacy in 1740, and whoſe humanity and extenſive learning is well known, publiſhed two bulls againſt the *Jeſuits*, wherein he excommunicated them, "for the practice of enſlaving their poor proſelytes, and treating them no better than animals whom men deprive of their liberty and domeſticate, with a view of making them uſeful in the moſt laborious employments; and for uſing religion as a cloak to oppreſſion, deſpotiſm, and tyranny; in order to deprive free-born beings and their fellow-creatures of liberty, the firſt and moſt precious of all enjoyments and privileges in this preſent life." Theſe bulls are the ſtrongeſt proofs of the ſpecious tyranny exerciſed by the *Jeſuits*; but as it is the natural tendency of human eſtabliſhments to degenerate from their firſt principles, it is very probable, that in the revolution of more than a century, theſe eccleſiaſtics had loſt much of that public ſpirit and philanthropy which might have actuated the firſt founders, and an oppreſſive and rapacious diſpoſition may be ſuppoſed to have ſucceeded.

M. de Bougainville, who touched at *Rio de la Plata* in 1767, when on his voyage round the world, had every opportunity that could be wiſhed of gaining information concerning this celebrated community; in farther deſcribing which, we ſhall therefore follow that very ingenious *Frenchman*, as we have already availed ourſelves of the information given by his countryman the marquis *de Pau*, in his admirable work, entitled, *Recherches ſur les Americains*. The extent of country in which the miſſions are ſituated is about two hundred leagues N. and S. and about one hundred and fifty E. and W. the number of inhabitants is eſtimated at three hundred thouſand. The immenſe foreſts afford wood of all ſorts; and the vaſt paſtures contain at leaſt two millions of cattle; fine rivers enliven the interior parts of this country, and promote circulation and commerce throughout it. The whole expence for the maintenance of the colonies was but ſmall, the *Indians*, as already obſerved, being fed, dreſſed, and lodged by the labour of their own hands; the heavieſt expences incurred were by keeping the churches in repair, all of which were built and adorned magnificently. The products of the ground and all the cattle belonged to the *Jeſuits*, who, on their part, ſent for the inſtruments of various trades, for glaſs, knives, needles, images, chaplets of beads, gunpowder, and muſkets. Their annual revenues conſiſted in cotton, tallow, leather, honey, and above all in *mate*, a plant better known by the name of *Paraguay* tea, or *South Sea* tea, of which the fathers had the excluſive commerce, and of which likewiſe the conſumption is immenſe in the *Spaniſh American* dominions, where it is uſed inſtead of tea.

The *Indians* ſhewed ſo ſervile a ſubmiſſion to their rectors, that not only both men and women ſuffered the puniſhment of flagellation, after the manner of the college, for public offences; but they likewiſe came of themſelves to ſolicit this chaſtiſement for mental faults. In every pariſh the fathers annually elected, from among the natives, corregidors, and their aſſiſtants, to take care of the *minutiæ* of the government. The ceremony of their election was performed on new year's day, with great pomp, in the court before the church, and was announced by ringing of bells, and the playing of a band of muſic. The newly elected perſons came to the feet of the father rector, to receive the marks of their dignity, which, however, did not exempt them from being whipped like the others. Their greateſt diſtinction was that of wearing habits, whereas a ſhirt of cotton ſtuff was the only dreſs of the other *Indians* of both ſexes. The feaſts of the pariſh, and that of the rector, were likewiſe celebrated by public rejoicings, and even by comedies, which probably reſembled thoſe ancient pieces of ours called myſteries. To theſe *Indians*, deprived of all property, and doomed to lead a life of labour, without its being enlivened and ſweetened with the proſpect of a reward, the invariable uniformity of labour and repoſe yielded no gratification, which well accounts for the tranquillity with which they quitted life. When they fell ſick, it ſeldom happened that they recovered; and being then aſked if they were ſorry to be obliged to die, they conſtantly anſwered, no. The *Jeſuits* repreſented the *Indians*, upon the whole, as men incapable of attaining to a higher degree of knowledge than that of children; but the life they led prevented theſe grown children from having the livelineſs of little ones.

In the year 1757, the king of *Spain*, in order to put a ſtop to the ſmuggling trade which was carried on between his ſubjects and the *Portugueſe* on the *Rio de la Plata*, exchanged the colonies on the eaſtern ſhore of the *Uraguay* for the *Portugueſe* colony of *San Sacramento*, which cauſed that river to became the boundary of the reſpective poſſeſſions of the two crowns. The *Indians* of the colonies which had been ceded were tranſported to the weſtern ſhore, and a compenſation made them for quitting their habitations. Theſe men, not willing to leave grounds which were highly cultivated, in order to clear others, took up arms, to the uſe of which they had long been accuſtomed, in order to defend themſelves from the incurſions of the *Pauliſts*; a band of robbers, deſcended from *Braſilians*, and who had formed themſelves into a republic toward the end of the 16th century. *Don Joſeph Andonaighi*, governor-general of the province of *La Plata*, marched againſt theſe inſurgents, and defeated them in a battle, wherein upward of 2000 *Indians* were ſlain. The entire reduction of the country followed this victory, but the intended exchange between the two crowns did not take place, ſo that matters ſoon after reverted to their former channel.

The commotions which happened in *Portugal* in 1766, and the expulſion of the *Jeſuits* from the different *Roman* catholic kingdoms of *Europe*, occaſioned the eſtabliſhment at *Paraguay* to be ſubverted by order of the *Spaniſh* court. *Don Franciſco Buccarelli* was appointed governor of *Buenos Ayres* in 1767, and to him this important buſineſs of diſpoſſeſſing the *Jeſuits* of their authority was entruſted. As it was doubtful whether the *Indians* would ſuffer the *Jeſuits* to be arreſted in the midſt of the colonies, and at all events ſuch a meaſure muſt be ſupported by a numerous body of troops, the governor reſolved to temporiſe, and wrote to the miſſions, that a corregidor and a cacique from each colony ſhould be ſent to him immediately, in order to communicate the king's letter to them. Theſe arrived on the 13th day of September 1767; and ſuch was the ſecrecy with which the meaſure was conducted, that no ſuſpicion was entertained in *Paraguay* of the deſigns formed by the court of *Spain*; the only inſtruction which the rectors gave their dear proſelytes at parting, was, to believe nothing of what the governor-general ſhould tell them: "Prepare, my children," did every one tell them, "to hear many untruths." By ſending for theſe principal *Indians*, two ends were to be anſwered; the one, that of getting hoſtages for the fidelity of the colonies, when the *Jeſuits* ſhould be removed from thence; the other, that of gaining the affection of the moſt conſiderable natives, by the good treatment intended for them at *Buenos Ayres*, and of inſtructing them in the new ſituation upon which they would enter: for, as ſoon as the mode of government ſhould be changed, they were to enjoy the ſame privileges, and have the ſame ſecurity for property as the other ſubjects of the king of *Spain*. On their arrival at *Buenos Ayres*, they proceeded to the governor's palace, and entering the court on horſeback, to the number of one hundred and twenty, formed a creſcent in two lines; a *Spaniard*, who underſtood the language of the *Guaranis*, acted as an interpreter. The governor appeared in a balcony; he told them they were welcome; that they ſhould go to reſt themſelves, and that he would ſend them notice of the day which he ſhould fix upon for acquainting them with the king's intentions. He added, in general, that he was come to releaſe them from ſlavery, and put them in poſſeſſion of their property, which they had not hitherto enjoyed. They anſwered by a general cry, lifting up their right hands to heaven, and wiſhing all proſperity to the king and governor. They did not ſeem diſcontented, but it was eaſy to diſcover more ſurpriſe than joy in their countenances. On leaving the governor's palace, they were brought to one of the houſes of the *Jeſuits*, where they were lodged, fed, and kept at the king's expence.

Soon after the news of the expulſion of the *Jeſuits* from every quarter, whether in *Europe* or *America*, had reached *Paraguay*, the provincial wrote a letter to the marquis *de Buccarelli*, in which he aſſured him not only of his ſubmiſſion, but of that of all the colonies, to the king's orders. In May 1768, the marquis ſat out on an expedition to *Paraguay*, and in a few weeks received the ſurrender of theſe fathers, without meeting with any obſtacle or reſiſtance. It was expected, that in ſeizing the effects of the *Jeſuits* very conſiderable ſums of money would be found; but it proved otherwiſe, and very little was obtained. Their magazines indeed were furniſhed with merchandizes of all ſorts, both of the produce of the country, and of goods imported from *Europe*: there were even many ſorts which could not have a ſale in thoſe provinces. The number of their ſlaves was conſiderable, and in their houſe at *Cardova* alone they reckoned three thouſand five hundred.

Theſe miſſions upon the *Uraguay* were not the only ones which the *Jeſuits* found in *South America*. Somewhat more northward, they had brought the *Mojos*, *Chiquitos*, and *Avipones*, to ſubmit to the ſame regulations. They likewiſe were making progreſs in the S. of *Chili*, toward the *Iſle of Chiloe*; and a few years before their ſuppreſſion, they opened a road from that province to *Peru*, paſſing through the country of the *Chiquitos*. In all the countries into which they penetrated, they erected poſts, on which they placed their motto; and on their map, the colonies which they had ſettled were deſcribed as *Oppida Chriſtianorum*. Whatever may have been the diſpoſition and views of this order of eccleſiaſtics in *Europe*, it does not appear that in *South America* it was diſtinguiſhed by a turbulent and ſeditious ſpirit. The contrary ſeems evident, both from the regularity and diſcipline which were introduced wherever their influence extended, and from their peaceable acquieſcence in thoſe orders of the king of *Spain*, which ſtripped them at once of their power and their wealth.

BUENOS AYRES.

BUENOS AYRES, which is included by *Ulloa* within the juriſdiction of *Los Charcas*, and termed the fifth biſhopric of that audience, received its name from the extraordinary ſalubrity of the air, and is extended to all that country from the eaſtern and ſouthern coaſt of that part of *America* as far as *Tucuman*, on the W.; on the N. to *Paraguay*, and on the S. to *Terra Magellanica*. This country is watered by the great river *La Plata*. The diſtinction between ſummer and winter is here very viſible. In ſummer the exceſſive heats are mitigated by gentle breezes, which conſtantly begin at eight or nine in the morning; and in winter violent tempeſts of wind and rain are very frequent, accompanied with ſuch dreadful thunder and lightning as fill the inhabitants, though habituated to them, with terror and conſternation.

There is no place, either in *America* or *Europe*, where meat is better or cheaper; it is always very fat and palatable, and in ſuch plenty, that it is ſaid the hides of the beaſt, being the moſt valuable article, are all that is properly bought, and the carcaſe is in a manner given in the bargain. The country to the W. N. and S. of the city of *Buenos Ayres* lately abounded ſo greatly in horſes and other cattle, that the whole coſt conſiſted in taking of them; and even then a horſe was ſold for a dollar, and the uſual price for a beaſt, choſen out of a herd of two or three hundred, was only four rials. At preſent there is no ſcarcity; but they keep at a greater diſtance, and are more difficult to be caught, from the prodigious havock made of them by the *Spaniards* and *Portugueſe*, merely for the ſake of their hides, which is the principal branch of the commerce of *Buenos Ayres*.

The capital of this government is called NUSTRA SENORA DE LA BUENOS AYRES. It was founded in 1535, on the S. ſide of the river *Plata*, cloſe by a ſmall river, in 34° 35′ S. latitude, and in 58° 31′ W. longitude from *Greenwich*. This city, which is built on a large plain, gently riſing from the little river, has at leaſt three thouſand houſes inhabited by *Spaniards* and different caſts. Like moſt towns ſeated on rivers, it is much longer than it is broad; but the ſtreets are ſtraight, and of a proper breadth. The principal ſquare is very large, and built near the little river; the front anſwering to it being a caſtle, in which the governor conſtantly reſides, and, with the other forts, has a garriſon, conſiſting of a thouſand regular troops. The houſes, which were formerly of mud thatched with ſtraw, and very low, are now much improved, ſome being of chalk, and others of brick, with one ſtory above the ground-floor, and moſt of them tiled. The cathedral is a ſpacious elegant ſtructure, and is the pariſh-church for the greateſt part of the inhabitants; the other at the farther end of the city being only for the *Indians*.

Within the government of *Buenos Ayres* are three other cities, named *Santa Fe*, *Las Corientes*, and *Monte Video*.

CHILI.

THE kingdom of *Chili* is very extenſive, but its limits are not exactly aſcertained; ſome confine it within the *Spaniſh* juriſdiction, others extend it from 26° to 47° S. latitude. It is bounded by *Peru* on the N. by the province of *La Plata* on the E. by *Patagonia* on the S.; and by the *South Sea*, or, as it is generally ſtyled, the *Pacific Ocean*, on the W.; containing a ſpace of between twelve and thirteen hundred miles in length, and about half as much in breadth, if we include the vaſt plains of *Chicuito*, lying on the oppoſite ſide of the lofty ridge of the *Andes*, which are here of a ſtupendous height; but the country, ſtrictly called *Chili*, lies between this chain of mountains and the *Pacific Ocean*, including a ſpace of only about ninety miles in breadth.

Beſide the rich variety of productions upon the ſurface of the earth, the country abounds with mines of *gold* and *ſilver*, *copper*, *tin*, and *iron*; and with quarries of *lapis-lazuli*, and *loadſtone*.

The number of inhabitants in this country bears no proportion to its great extent. All the *Spaniards* in *Chili* are ſaid not to exceed twenty thouſand, and theſe are diſperſed in ſuch a manner as hath given the free *Indians* the greateſt advantages in all their wars with them. This was the great overſight of *Valdivia*, the firſt invader of *Chili*, who, upon his diſcovering gold, attempted to make ſo many eſtabliſhments, as furniſhed the *Indians*, whom he had treated very cruelly, with an opportunity of recovering their liberty and driving the *Spaniards* from their mountains. The *Europeans*, *Meſtizos*, *mulattoes*, and *negroes*, are reputed at an hundred and fifty thouſand; but the *Indians* are much more numerous.

The *Chileſians* are tall, robuſt, active, and courageous. No other *Indian* people have given the *Spaniards* ſo much haraſſment; for they are dexterous in the uſe of the ſword, pikes, bows, and arrows; and their diſcipline is more regular and judicious than that of any other *Indian* nation. They fight in ſquadrons, retire when broken, rally, fortify themſelves with great addreſs, and chooſe their ground with admirable judgment.

The *Indians* in ſeveral parts of *Chili* are not governed by caciques like thoſe of *Peru*, the only ſubordination among them being founded on age; ſo that the eldeſt perſon of the family is reſpected as its governor.

In time of peace the *Spaniards* ſell to the free *Indians* hard-ware, as bits, ſpurs, knives, and edge-tools; alſo toys, and ſome wine. This is done by way of barter; for though the countries inhabited by the *Indians* are not deſtitute of gold, yet knowing the fondneſs of the *Spaniards* for that metal, and the miſeries it has occaſioned where it has been found, they cannot be prevailed upon to open mines; ſo that the returns conſiſt in horſes, horned cattle, and cotton-cloth. The *Spaniard* begins his negociation with offering the chief of the nation a cup of wine, and then diſplays his wares, that the *Indian* may chooſe what he likes beſt, mentioning at the ſame time what he expects in return. If they agree, the *Spaniard* makes him a preſent of a little wine, and the chief informs the community that they are at liberty to trade with that *Spaniard* as his friend. Relying on his protection, the *Spaniard* goes from hut to hut, recommending himſelf by giving the head of every family a taſte of his wine, after which they enter upon buſineſs, and the *Indian* having taken what he wants, the trader goes away without receiving any equivalent, and viſits the other huts, as they lie diſperſed over the country, till he has diſpoſed of all his ſtock. He then returns to the cottage of the chief, calling on his cuſtomers in his way, and acquaints them that he is on his return home. Upon this not one fails of bringing to the chief's hut what had been agreed on. Here they take their leave with all the appearance of a ſincere friendſhip, and the chief even orders ſome *Indians* to eſcort the trader to the frontiers, and aſſiſt him in driving the cattle he has received in exchange for his goods. The *Spaniards* acknowledge that the *Indians* are remarkable for the fairneſs of their dealings, that they are never known to recede from what has been agreed on, and are very punctual in their payments.

CHILI is divided into four governments; namely, the major-generalſhip of the kingdom of *Chili*, *Valparaiſo*, *Valdivia*, and *Chiloe*. It is likewiſe ſubdivided into eleven juriſdictions; the limits of which are not exactly aſcertained by any of the *Spaniſh* authors.

The city of ST. JAGO, or SANT YAGO, the capital of *Chili*, was founded by captain *Pedro de Valdivia* in 1541, in the valley of *Mapocho*, in 33° 50′ S. latitude, and in 70° W. longitude, from *Greenwich*, about twenty leagues from the harbour of *Valparaiſo*, the neareſt port on the *Pacific Ocean*. Its ſituation is one of the moſt convenient and delightful that can be imagined, ſtanding in a beautiful plain, ſixty miles in extent, the river *Mapocho* flowing in meanders through the middle of it. The city is two thouſand yards in length from E. to W. and twelve hundred in breadth from N. to S. On the oppoſite ſide of the river, which waſhes the N. part of it, is a large ſuburb named *Chimba*, and on the E. is a mountain of a middling height called *Santa Lucia*. All the ſtreets are of a handſome breadth, ſtraight, and paved, running exactly E. and W. while they are croſſed by others at right angles, which run exactly N. and S. Near the middle of the city is a grand ſquare encompaſſed by piazzas, with a very beautiful fountain in the centre.

The houſes in general are built of unburnt brick, and very low, on account of the terrible devaſtation occaſioned by the earthquakes with which this city has been often viſited, particularly on the eighth of July, 1730, when the greateſt part was deſtroyed; and this cataſtrophe was ſucceeded by an epidemical diſtemper, which ſwept away even greater numbers than had before periſhed by the earthquake.

The city of CONCEPTION is ſeated in 36° 43′ S. latitude. It is built on the S. E. ſhore of a beautiful bay, on an uneven ſandy ground, and on a ſmall declivity, having a little river running through it. The deſtruction it ſuffered in the terrible earthquake of 1730, occaſioned all the houſes to be built low. This dreadful event happened on the eighth of July: the firſt motions were felt at one in the morning, and the concuſſions increaſing, the ſea, as uſual, retreated to a conſiderable diſtance; but ſoon returned ſo impetuouſly, and with ſuch a ſwell, that it overflowed the whole city and the neighbouring countries. In this ſudden calamity many of the inhabitants found an aſylum on the adjacent eminences. This inundation was ſoon ſucceeded by three or four ſhocks, and at about four in the morning, a little before break of day, the concuſſions returned with the moſt tremendous violence, demoliſhing the few buildings that remained.

The people here are excellent horſemen, and the women are particularly famous for their great ſkill in horſemanſhip; they are remarkably ſkilled in throwing a nooſe, whereby they entangle and catch wild bulls and other animals; but this nooſe is likewiſe uſed on many other occaſions, particularly on private quarrels, in which they uſe an amazing addreſs both in throwing it, and in avoiding it with a lance. It is the only method they take to gratify their revenge.

COPIAPO, the firſt port on this coaſt, ſtands in 27° S. latitude. This town, from its natural ſituation, is metaphorically ſaid to be the richeſt in the world, it being ſeated on a gold mine; which, however, is not wrought, becauſe a ſtill richer mine of that metal has been diſcovered at ſix miles diſtance. To the S. of the town are the rich *lead mines* of *Capiapo*, which lie neglected; yet ſeveral intelligent writers are of opinion they might be turned to more advantage than the gold mines, on account of the great quantities of *lapis lazuli* found on the ſurface.

VALPARAISO is ſituated in 33° 3′ S. latitude, and is at preſent both large and populous, it having the moſt conſiderable haven in thoſe ſeas, conſtantly filled with ſhips from *Callao* and *Panama*; it would be ſtill larger were it not for its inconvenient ſituation, at the foot of a mountain, and a great part of the houſes being built on its acclivity: the broadeſt and moſt convenient part is that along the coaſt; but this is very diſagreeable in winter, it being ſo expoſed to the N. winds, that the waves beat againſt the walls of the houſes, ſome of which are built with unburnt bricks, and ſome are of chalk and pebbles.

Here is a military governor nominated by the king, who having the command of the garriſons in the ſeveral ports, and of the militia of the town and its dependencies, is to take care that they are properly diſciplined.

The proximity of *Valparaiſo* to *St. Jago* has drawn hither all the commerce formerly carried on at that city, and to this it owes its foundation, increaſe, and proſperity. The cargoes brought hither by the *Callao* ſhips are indeed but ſmall, but they take from hence wheat, dried fruits, *Cordovan* leather, tallow, and cordage. A ſhip has been known to make three voyages in one ſummer, that is, between November and June; during which the droves of mules and carriages from all the farms in the juriſdiction of *St. Jago* bring freſh ſupplies to the warehouſes. Thus the ſummer ſeaſon may be termed the fair of *Valparaiſo*; but on the approach of winter it becomes as remarkably deſolate, the crowd of traders repairing to *St. Jago*, and none ſtaying that are able to remove.

The fruits that grow in the neighbourhood of this town are admirable for their ſize and beauty, particularly a ſort of apple called *quillots*, which greatly exceeds the largeſt in *Spain*; and, beſide its exquiſite flavour, is ſo juicy that it melts in the mouth. Among the ſeveral kinds of game, there are here ſuch flights of partridges in their ſeaſon, which begins in March, and laſts ſeveral of the following months, that the muleteers knock them down with their ſticks, without going out of the road, and bring great numbers of them to *Valparaiſo*: but few of theſe, or any other birds, are ſeen very near the town. It is the ſame with regard to fiſh, very little being to be caught either in the harbour or along the coaſt.

BALDIVIA, or VALDIVIA, a celebrated port, is ſeated at the bottom of a fine bay, in 39° 6′ S. latitude, and in 75° W. longitude, from *Greenwich*. It takes its name from *Valdivia*, the *Spaniſh* general, who conquered the country. A conſiderable ſum is annually granted to keep the fortifications in repair, which conſiſt of four ſtrong caſtles, mounting above a hundred pieces of fine braſs cannon; for which, however, it is ſaid, there is never a ſufficient number of gunners and carriages, nor ever a proper ſupply of ammunition: and the garriſon is chiefly compoſed of malefactors tranſported from *Spain*. The governor is indeed always a perſon of quality; but as he is promoted merely to repair his fortune, it is expected he ſhould improve the opportunity. The inhabitants amount to about two thouſand, who are chiefly *Spaniards*, *Creoles*, and *Meſtizos*. Its trade is leſs conſiderable than formerly, becauſe the gold mines in its neighbourhood are ſhut up; yet ten large ſhips are employed in the trade between this port and *Lima*.

The iſland of CHILOE, the laſt of the governments, extends from 42° to 44° 10′ S. latitude, and is about a hundred and fifty miles in length, and ſeventeen in breadth. The coaſt is very ſubject to ſtorms, eſpecially in March, when winter ſets in. The iſland has a military governor, who reſides at *Chacao*, the principal harbour of the iſland, which is well fortified, and capable of making a good defence.

SECT. IV.

Portuguese America; *containing* Brasil, *the Rivers* Amazon *and* La Plata.

THE *Portugueſe*, by whom this country was firſt diſcovered, gave it the name of the *Holy Croſs*; but it afterward obtained the name of *Braſil*, or *Brazil*, from the great quantity of *Braſil* wood which grows there, which was known in *Europe*, and called *Braſil*, before the diſcovery of the extenſive country that bears its name.

Brasil is ſeated between the mouth of the great river of the *Amazons*, near the equator, and the river *Plata*, in 35° S. latitude, and between 36° and 50° 15′ W. longitude from *Greenwich*; and is bounded on the N. by the mouth of the river of the *Amazons* and the *Atlantic* ocean; on the E. by the ſame ocean; on the S. by the river *Plata*, and on the W. by a chain of mountains which divide it from *Spaniſh America* and the country of the *Amazons*; it being two thouſand five hundred miles in length along the coaſt from N. to S. and about nine hundred miles in breadth. The ſettlements of the *Portugueſe*, however, extend but a ſmall diſtance within land.

The river of the *Amazons*, which is the northern boundary of *Braſil*, as it has its ſource among the *Andes*, which are the higheſt mountains on this globe, ſo it is the greateſt river in the world. Its riſe is not far from the *Pacific Ocean*, and it runs in an eaſtern courſe, according to *Ulloa* and *Condamine*, more than twelve hundred leagues, in which progreſs it received above ſixty conſiderable rivers. In ſome parts it divides into ſeveral branches encompaſſing a multitude of iſlands, and at length diſcharges itſelf into the *Atlantic Ocean*, directly under the equinoctial line, by a channel 150 miles broad.

The *Rio de la Plata*, or river of *Plate*, likewiſe riſes among the mountains on the weſtern ſide of *South America*; its courſe is ſaid to be more than eight hundred leagues, in which it receives above fifty rivers; it diſcharges itſelf into the *Atlantic Ocean* by a very extenſive mouth, its northern coaſt being in 35° and its ſouthern in 36° 20′ S. latitude.

The land near the coaſt is, in general, rather low than high; but extremely pleaſant, being interſperſed with meadows and woods, the trees of which are for the moſt part evergreens; but on the W. far within land, are mountains in which are innumerable ſprings and lakes, whence abundance of rivers iſſue, which either fall into one or other of the three great rivers, or run acroſs the country from W. to E. and fall into the *Atlantic* ocean; theſe independent ſtreams are very numerous, and of great uſe to the *Portugueſe* in turning their ſugar mills, and meliorating thoſe lands which they annually overflow.

The ſoil of *Braſil* is generally good, producing very large trees of various ſorts, fit for any uſe. Their ſavannas, or meadows, are covered with graſs and herbs, and, where cultivated, produce every thing proper for the climate, as *ſugar-canes*, *tobacco*, *cotton*, *indigo*, *maize*, and *fruit*.

No ſort of corn thrives in *Braſil* like *maize*, for wheat and rye grow too rank, and run up into ſtraw. Their ſeed-time is at the beginning of the rainy ſeaſon, and their harveſt a little after it is over. The trees and ſhrubs proper to the country bear leaves, bloſſoms, and fruit, all the year round; and the ſame is obſerved of their oranges, limes, and ſome other fruits that have been carried thither. It is ſaid that thoſe who would have ripe grapes all the year, only prune their vines at different times to effect it, and they produce a fine luſcious grape as ſweet as honey; and yet they can make no wine here that will keep.

As to their minerals they have *gold*, and ſome *ſilver*; and here are found plenty of rich *diamonds*, *jaſper*, *emeralds*, and other precious ſtones.

Gold was firſt found in the mountains which lie adjacent to the city of *Rio Janeiro*. The occaſion of its diſcovery is variouſly related; but the common account is, that the *Indians* on the back of the *Portugueſe* ſettlements were obſerved by the ſoldiers, employed in an expedition againſt them, to make uſe of this metal for their fiſhing-hooks; and their manner of procuring it being enquired into, it appeared that great quantities of it were annually waſhed from the hills, and left among the ſand and gravel that remained in the vallies after the running off, or evaporation of the waters. It is now little more than eighty years ſince any quantities of gold, worthy notice, have been imported from *Braſil* to *Europe*; but from that time the annual imports from thence have been continually augmented by the diſcovery of places in other provinces, where it is to be met with as plentifully as at firſt about *Rio Janeiro*. And it is now ſaid that a ſmall ſlender vein of it ſpreads through all the country at about twenty-four feet from the ſurface; but that this vein is too thin and poor to anſwer the expence of working the mine. However, where the rivers or rains have had any courſe for a conſiderable time, there gold may always be collected, the water having ſeparated the metal from the earth, and depoſited it in the ſands; whence to divert a ſtream from its channel, and to ranſack its bed, is held to be an infallible means of procuring it. Indeed there are properly no gold mines in *Braſil*, all the gold being collected either from rivers, or the beds of torrents after floods.

The ſlaves, who are principally negroes, are kept in great numbers to examine the bottoms of rivers, and the gullies of torrents, and to waſh the gold found in them from the ſand and dirt. The regulation of the duty of theſe ſlaves is very ſingular, for they are each of them obliged to furniſh their maſter with the eighth part of an ounce of gold every day; and if they are either ſo fortunate or induſtrious as to collect a greater quantity, the ſurplus is generally conſidered as their own property, and they have the liberty of diſpoſing of it as they think fit: ſo that it is ſaid ſome negroes, who have accidentally fallen upon rich waſhing-places, have themſelves purchaſed ſlaves, and have afterward lived in great ſplendor, their original maſter having no other demand on them than the daily ſupply of the above eighth part, which, as the *Portugueſe* ounce is ſomewhat lighter than our troy ounce, may amount to about nine ſhillings ſterling.

The quantity of gold thus collected in the *Braſils*, and annually returned to *Liſbon*, may in ſome degree be eſtimated from the amount of the king's fifth: this has been computed one year with another at one hundred and fifty arroves of thirty-two pounds *Portugueſe* weight, which, at four pounds the troy ounce, makes very near three hundred thouſand pounds ſterling; and conſequently the capital, of which this is the fifth, is about a million and a half ſterling. The annual return of gold to *Liſbon* cannot be leſs than this, though it be difficult to determine how much it exceeds it. It has been ſuppoſed that the gold exchanged for ſilver with the *Spaniards* at *Buenos Ayres*, and what is privately brought to *Europe*, amounts to near half a million more, which will make the whole annual produce of the *Braſilian* gold near two millions ſterling; a prodigious ſum to be found in a country which, at the cloſe of the laſt century, was not known to furniſh a ſingle grain.

As to *diamonds*, the diſcovery of theſe valuable ſtones is ſtill more recent, it being ſcarce forty years ſince the firſt were brought to *Europe*. They are found in the ſame manner as the gold, in the gullies of torrents and beds of rivers, but only in particular places, and not ſo univerſally ſpread through the country. They were frequently found in waſhing the gold before they were known to be diamonds, and were conſequently thrown away with the ſand and gravel ſeparated from it. It is well remembered that numbers of very large ſtones, that would have enriched the poſſeſſors, have paſſed unregarded through the hands of thoſe who afterward bore with impatience the mortifying reflection. However, about fifty years ago, a perſon, acquainted with the appearance of rough diamonds, imagined that theſe pebbles, as they were then eſteemed, were of the ſame kind: but it is ſaid there was a conſiderable interval between the firſt ſtarting of this opinion, and its being confirmed by proper trials, it being difficult to perſuade the inhabitants, that what they had been long accuſtomed to deſpiſe, could be of ſuch importance as this diſcoverer ſuppoſed. And it is ſaid that in this interval a governor of one of their places procured a great number of theſe ſtones, which he pretended to make uſe of in playing at cards inſtead of counters. But it was at laſt confirmed by ſkilful jewellers in *Europe*, who were conſulted on this occaſion, that theſe ſtones were real diamonds, and many of them not inferior, either in luſtre or any other qualification, to thoſe of the *Eaſt Indies*. Upon this diſcovery the *Portugueſe*, in the neighbourhood of the places where they had been found, began to ſearch for them with great aſſiduity; and they had even hopes of diſcovering conſiderable maſſes of them, as they perceived large rocks of cryſtal in many of the mountains from whence the ſtreams came that waſhed down the diamonds.

It was however ſoon repreſented to the king of *Portugal*, that if ſuch abundance of diamonds ſhould be obtained as were now expected, their value would be ſo debaſed that, beſide ruining all the *Europeans* who had any quantity of *Indian* diamonds in their poſſeſſion, it would render the diſcovery itſelf of no importance, and prevent his majeſty from receiving any advantages from it. On theſe conſiderations the king thought proper to reſtrain the general ſearch for diamonds, and for that purpoſe erected a diamond company with an excluſive charter. This company, in conſideration of a ſum paid to the king, is veſted with the property of all diamonds found in *Braſil*: but, to prevent their collecting too large quantities, and thereby reducing their value, they are prohibited from employing above eight hundred ſlaves in ſearching for them. And to prevent any of his other ſubjects from acting the ſame part, and to ſecure the company in their excluſive privilege, the king depopulated a large town, with a conſiderable diſtrict round it, which abounded with theſe pebbles, and obliged the inhabitants, who were ſaid to amount to ſix thouſand, to remove to another part of the country; it being thought impoſſible to prevent ſuch a number of people who were on the ſpot from obtaining theſe precious ſtones.

THE beaſts that were found in this country on its being firſt diſcovered, were in general the ſame with thoſe of *Mexico* and *Peru*, particularly the *Peruvian* ſheep, the *pacaree*, called by the *Europeans* the hog, from their bearing ſome reſemblance to that animal, a great variety of *monkies*, *deer*, *hares*, and *rabbits*, ſome *lions* and *tygers*; but theſe are neither ſo large nor ſo fierce as thoſe of *Africa*; the *ant-bear*, the *porcupine*, the *racoon*, and *flying-ſquirrel*, the *armadillo*, the *opoſſum*, the *guano*, and the *ſloth*.

The *ant-bear* is as long and as tall as a middle-ſized dog; his hind-legs reſemble thoſe of a bear, but his fore-legs are more ſlender: his fore-feet are flat, and divided into four toes, armed with long claws; but thoſe behind have five toes. His head is long, with a ſharp ſnout, ſmall round black eyes, and very black ears: the tongue is ſaid to be upward of two feet in length, but very ſlender: he is obliged to bend part of his back when he keeps it within his mouth, the jaws being otherwiſe too ſhort to contain it. He lives upon ants, and when he has found any of their neſts, he opens the upper part of them with his claws, that he may have room to put in his ſnout and his tongue; this is beſmeared with a ſlimy liquor, and is ſoon covered with ants, when he draws it into his mouth, and ſwallows them. This he repeats as long as they will run into the ſame ſnare. The tail of this animal in ſome meaſure reſembles that of a fox; it is generally two feet long, almoſt flat, and covered with hair from fifteen to twenty inches long; it is harſh, very ſtrong, and he can move it juſt as he pleaſes; when he turns it upon his back, it entirely covers it, and defends him from the rain, which he greatly diſlikes.

The *armadillo* has his head, body, and tail, covered with a ſhield of a bony ſubſtance, forming moſt beautiful ſcales. On the upper part of the neck are two joints that he may move his head, and on the back ſeven diviſions, with a yellow ſkin between each. The feet are covered with a thinner ſhield, but the lower parts of the body are without this covering. The head is like that of a hog, with a ſharp ſnout. He has ſmall eyes ſunk deep in the head, and a narrow pointed tongue. The ears are naked, brown, and ſhort, and the teeth of a middle ſize. The feet reſemble hands, with five fingers and roundiſh nails. The tail at the root is near four inches thick, but grows gradually leſs to the end, where it terminates in a point. It lives upon melons, potatoes, and other roots, but will not eat fleſh, and generally lies hid in the ground, which he turns up with his ſnout. This animal has a quick feeling, and will roll himſelf up like a ball. The fleſh is white, fat, and delicate, but is beſt when ſeaſoned with ſpices to quicken the taſte.

The feathered race in this country is very numerous and various.

In ſome parts of *Braſil* the heat of the climate is ſuppoſed to favour the generation of a great variety of poiſonous inſects and reptiles; and it is certain, that no country produces a greater variety of ſerpents, ſome of which are ſaid to be of an incredible length. The rattle-ſnake and other reptiles of the ſame ſpecies grow to an enormous ſize; and the ſerpent called ibibaboca, is affirmed to be ſeven yards long, half a yard in circumference, and poſſeſſed of a poiſon inſtantaneouſly fatal to mankind. Indeed, the accounts authors have given of the monſtrous ſize of theſe reptiles here are ſo very improbable, that little credit ought to be given to them.

Here are alſo *ſcorpions*, *centipedes*, *ſpiders*, and other inſects that are venomous, and of an extraordinary ſize. Their *ants* are almoſt as troubleſome here as in *Africa*, marching in great bodies, and devouring every thing in their way. Here is alſo the *fire-fly*, which ſeems to differ but little from the glow-worm, except in having wings: when a number of theſe fix on the boughs of trees, they in the night appear at a ſmall diſtance like ſo many ſtars. There are ſaid to be here twelve ſeveral ſorts of bees, ſome of which have vaſt neſts in hollow trees in the woods, and others in holes of the rocks, and yield great quantities of honey and wax.

Their ſeas, lakes, and rivers, are full of excellent fiſh; the lean fleſh of the whales, of which there are plenty on this coaſt, is eaten by the ſlaves and poor people of *Braſil*. The beſt fiſh on the coaſt is the *manattee*, which is as large as an ox.

BRASIL is uſually divided into fifteen provinces, or captainſhips, of which eight only are annexed to the crown, the reſt being fiefs made over to ſome of the nobility on account of their extraordinary ſervices, who do little more than acknowledge the ſovereignty of the king of *Portugal*. However, the whole gives the title of prince to the preſumptive heir to the crown of *Portugal*. Theſe captainſhips are *Para*, *Maragnan*, *Siara*, *Poligi*, or *Rio Grande*, *Parayba*, *Tamara Fernambuco*, *Seregippe*, *Bahia de Todos Santos*, *Ilheos*, *Porto Seguro*, *Spirito Sancto*, *Rio Janeiro*, *St. Vincent*,, and *Del Rey*.

The principal city is ST. SALVADOR, alſo called the city of BAHIA, which is in the province of the ſame name, and was thus called from the commodiouſneſs of its harbour. It is ſeated on a hill, in 12° 11′ S. latitude. It is populous, magnificent, and beyond compariſon the moſt gay and opulent city in all *Braſil*. The trade carried on here is prodigious; the gentry are polite; but the vulgar, who have acquired wealth, are intolerably inſolent and brutal. In this city are no leſs than twelve or fourteen thouſand *Portugueſe*, with three times that number of negroes. The harbour is capable of receiving ſhips of the greateſt burden, and its entrance is guarded by a ſtrong fort called *St. Antony's*.

There are other ſmall forts that command the harbour, one of which is built upon a rock about half a mile from the ſhore. Cloſe by this fort all ſhips muſt paſs that anchor here, and muſt alſo ride within half a mile of it, between this and another fort that ſtands on a point at the inner part of the harbour. Beſide theſe, there is another fort on the hill upon which the town ſtands.

The chief mechanic trades in this city are *hatters*, *ſmiths*, *ſhoe-makers*, *ſawyers*, *carpenters*, *coopers*, and *taylors*. All theſe buy negroes, whom they train up to their ſeveral employments. Theſe ſlaves are alſo very uſeful as porters, for as there is here a great trade by ſea, and the landing-place is, at the foot of the hill, too ſteep for the paſſage of carts, there is a great need of ſlaves to carry the goods up into the town: but the merchants have the convenience of cranes with ropes, one end of which goes up, while the other is let down. The houſe in which the crane is, ſtands on the brow of the hill toward the ſea, and there are planks ſet ſhelving all the way up, againſt which the goods ſlide as they are hoiſted up or let down.

THE preſent inhabitants of *Braſil* are *Portugueſe*, *Creoles*, *Meſtizes*, *Negroes*, and *Braſilians*. The *Portugueſe* of *Europe*, who enjoy the places of truſt and profit, are the feweſt in number; the *Creoles*, or thoſe born of *Portugueſe* parents in *Braſil*, are more numerous; and, the *Meſtizes*, or mixed breed, are ſtill more numerous than either; for few of the *Portugueſe* have been without black or tawny miſtreſſes, and the iſſue of theſe having intermarried, they are multiplied extremely. The negroes are alſo very numerous, and thoſe ſlaves are much more valued than the *Braſilians*, they being of a more robuſt conſtitution and fitter for labour; for as they come from the coaſt of *Africa*, oppoſite to *Braſil*, which is much hotter, they endure fatigue in the hot ſeaſon better than the natives; nor are the latter very numerous, the *Portugueſe* in their invaſion of the country, like the *Spaniards* in their conqueſts, deſtroying thoſe unfortunate people by all the cruel methods they could invent.

The portrait given us of the manners and cuſtoms of the *Portugueſe* in *America*, by the moſt judicious travellers, is very far from being favourable. They are deſcribed as a people, who, while ſunk in the moſt effeminate luxury, practiſe the moſt deſperate crimes: of a temper hypocritical and diſſembling; of little ſincerity in converſation, or honeſty in dealing; lazy, proud, and cruel. In their diet penurious; for, like the inhabitants of moſt ſouthern climates, they are much more fond of ſhew, ſtate, and attendance, than of the pleaſures of the table and free ſociety, yet their feaſts, when made, which is ſeldom, are extravagantly ſumptuous.

The pride, indolence, luxury, and cruelty of the maſters, has, among other cauſes, been attributed to their being bred up among ſlaves, who perform all the buſineſs; and to their being permitted to keep a prodigious number of negroes, not merely to work in the field, nor for domeſtic employments, but ſolely for ſtate, to attend their perſons, and form their train. Theſe become as corrupt as their maſters, who make them the inſtruments of their crimes; and, giving them an unbounded and ſcandalous licence, employ them as bullies or aſſaſſins whenever they are diſpoſed to terrify, or to ſeek revenge. Indeed, nothing can be conceived more adapted to create the worſt diſorders, than the unnatural junction of ſlavery, idleneſs, and a licentious life. Slaves here are frequently ſuffered to go armed, and there are vaſt numbers who have bought their freedom; yet in this country the negroes are ſaid to be ten times the number of the *Portugueſe* and *Creoles*.

However, this picture is perhaps too highly coloured; it at beſt does not reſemble thoſe in the northern captainſhips, nor thoſe in the moſt ſouthern, by the *Rio Janeiro*, who are far from being ſo effeminate and corrupted as thoſe of *St. Salvador*.

The *Portugueſe* and *Dutch* writers called the *Braſilians*, who inhabit the N. part of the country, *Tapuyers*, and thoſe who dwell in the S. *Tupinambes*; but divide theſe into ſeveral petty nations, differing in language, though very little in their manners and cuſtoms.

The *Tapuyers* are of a good ſtature, and of a dark copper colour; their hair black and hanging over their ſhoulders; but they have none on their bodies or faces, and go almoſt naked, the women only wearing at their waiſt a ſlight covering of leaves. Their ornaments are glittering ſtones hung upon their lips or noſtrils, bracelets of feathers about the arms, and a circlet of feathers upon their heads. Some paint their bodies of all manner of colours, while others rubbing them with gums ſtick beautiful feathers upon them, which makes them at a diſtance look more like fowls than human creatures.

The *Tupinambes*, who inhabit the S. of *Braſil*, are of a moderate ſtature, and of a leſs dark complexion than their northern neighbours, who lie nearer the line; but neither of them are ſo black as the *Africans* in the ſame latitude, for there were no negroes in *America* before they were tranſported thither by the *Spaniards* and *Portugueſe*. Theſe people have however flat noſes, which are not natural, but ſo formed in their infancy; a flat noſe there being eſteemed a beauty: they have alſo black curled hair on their heads, and paint themſelves like the northern *Braſilians*.

The native *Braſilians* are at preſent a tractable and ingenious people, ready to learn any art or ſcience the *Portugueſe* are diſpoſed to teach them; and take nothing ſo kindly of the prieſts as their inſtructing their children, which has given them an opportunity of making many converts; thoſe who live under the *Portugueſe* generally conform to their cuſtoms in eating, drinking, and clothing, and few of theſe go naked.

Government of BRASIL.

THE government of *Braſil* is committed to a Viceroy, who reſides at *St. Salvador*. He has two councils, one for criminal, the other for civil affairs, in both which he preſides: but, to the extreme injury of the ſettlement, all the delay, chicanery, and multiplied expences incident to the worſt part of the law, and practiſed by the moſt corrupt lawyers, flouriſh here; at the ſame time that juſtice is ſo relaxed, that the greateſt crimes are often ſuffered to paſs with impunity.

The *Portugueſe* in *Braſil* are ſufficient to maintain the dominion of that country againſt any other power; they have a good number of *European* regular troops; the militia too is regulated, among whom there are ſome bodies of *Indians* and free negroes. On the other hand, the *Portugueſe*, *Creoles*, *Meſtizes*, *Negroes*, and *Braſilians*, are now in a manner one people, their religion the ſame, and their blood intermixed by marriages; and therefore, however they may diſagree among themſelves while they have no enemy to contend with, they would infallibly unite againſt all the reſt of the world.

The trade of *Portugal* is carried on upon the ſame excluſive plan as is adhered to by the other *European* nations toward their *South American* colonies, and reſembles the *Spaniſh* method in not ſending out ſingle ſhips, as the convenience of the ſeveral places, and the judgment of the *European* merchants, may direct; but by annual fleets, which ſail at ſtated times from *Portugal*, and compoſe three flotas, bound to as many parts in *Braſil*, namely, to *Fernambuco* in the northern part, to *Rio Janeiro* at the ſouthern extremity, and to *Bohia de Todos Santos*, or the bay of *All Saints* in the middle, where is the capital, and there all the fleets rendezvous on their return to *Portugal*.

The trade of *Braſil* is very great, and increaſes every year; which is the leſs ſurpriſing as the *Portugueſe* have opportunities of ſupplying themſelves with ſlaves for their ſeveral works at a much cheaper rate than any other *European* power that has ſettlements in *America*; the ſituation of *Braſil* being very convenient, as it is nearer to *Africa* than any other part of *America*. Hence it is principally that *Braſil* is the richeſt, moſt flouriſhing, and improving eſtabliſhment in all *South America*. The *ſugar* exported thence is very great, and is finer than that grown on either the *French* or *Spaniſh* ſugar plantations.

Their *tobacco* is alſo remarkably good, though not raiſed in ſuch large quantities as in *Virginia*. The northern and ſouthern parts of *Braſil* abound with horned cattle; theſe are hunted for their hides, of which no leſs than twenty thouſand are annually ſent into *Europe*.

A conſiderable part of the gold brought from *Braſil* is previouſly coined there: thus, that coined at *Rio Janeiro* bears an R, and that which is ſtruck at *St. Salvador*, or the *Bay*, is marked with a B. Of the diamonds, there are ſuppoſed to be returned to *Europe* the value of one hundred and thirty thouſand pounds. This, with the ſugar, which is principally the cargo of the *Fernambuco* fleet, the tobacco, the hides, the valuable drugs for medicines and manufactures, may give ſome idea of the importance of this trade, not only to *Portugal*, but to all the trading powers of *Europe*.

Not the fifteenth part of the commodities which the *European* ſhips carry thither are the produce or manufacture of *Portugal*; they conſiſt of the woollen goods of all kinds of *England*, *France*, and *Holland*; the linen and laces of *Holland*, *France*, and *Germany*; the ſilk of *France* and *Italy*; ſilk and thread ſtockings, hats, lead, tin, pewter, iron, copper, and all ſorts of utenſils wrought in theſe metals, which have been till lately ſent from *England*; as well as flour, ſalt fiſh, beef, and cheeſe. They have oil from *Spain*: wine, with ſome fruit, is nearly all they are ſupplied with from *Portugal*.

St. Catharine's.

Before we take leave of *Braſil*, we ſhall deſcribe *St. Catharine's*, the principal iſland on the coaſt of the ſouthern part of this country. It is no where above ſix miles in breadth, though about twenty-ſeven in length. It lies in 27° 35′ S. latitude, and in 49° 17′ W. longitude from *Greenwich*.

Though it is of a conſiderable height, it is ſcarce perceivable at ten leagues diſtance, being then obſcured by the continent of *Braſil*, the other mountains there riſing exceeding high; but, on a nearer approach it is eaſily diſtinguiſhed, and may be known by a number of ſmall iſlands lying at each end, and ſcattered along the E. ſide of it. The harbour is defended by ſeveral forts.

The ſoil is truly luxuriant, ſpontaneouſly producing fruits of many kinds, and the ground is covered with one continued foreſt of trees of a perpetual verdure, which, from the exuberance of the mould, are ſo entangled with briars, thorns, and underwood, as to form a thicket abſolutely impenetrable, except by ſome narrow paths which the inhabitants have made for their own convenience. Theſe, with ſome ſpots cleared for plantations along the ſhore facing the continent, ſeem the only open parts of the iſland. The woods are extremely fragrant from the many aromatic trees and ſhrubs with which they abound; and the fruits and vegetables of all climates thrive here, almoſt without culture, and are to be procured in great abundance.

The fleſh proviſions are however much inferior to the vegetables; there are indeed to be purchaſed ſmall wild cattle, ſomewhat like buffaloes; but theſe are very indifferent food, their fleſh being of a looſe contexture, and generally of a diſagreeable flavour, owing perhaps to the wild calabaſh on which they feed. There are alſo great plenty of *pheaſants*, but they are far inferior in taſte to thoſe we have in *England*. The other proviſions are monkeys, parrots, and fiſh of various ſorts, which abound in the harbour, are extremely good, and eaſily caught.

The water both on the iſland and the oppoſite continent is excellent, and keeps at ſea as well as that of the *Thames*, for after it has been in the caſk a day or two it purges itſelf, ſtinks moſt intolerably, and is ſoon covered with a green ſcum, which in a few days ſubſides to the bottom, leaving the water as clear as cryſtal, and perfectly ſweet.

Theſe are the advantages of the iſland; but it has ſeveral inconveniences attending it, particularly with reſpect to the climate; for the woods and hills which ſurround the harbour, prevent a free circulation of air; and the vigorous vegetation, which conſtantly takes place there, furniſhes ſuch a prodigious quantity of vapour, that all the night, and a great part of the morning, a thick fog covers the whole country, and continues till either the ſun gathers ſtrength to diſſipate it, or it is diſperſed by a briſk ſea breeze. This renders the place cloſe and humid. Strangers are here alſo much peſtered with a multitude of muſkettos, which are all day extremely troubleſome, and at ſun ſet, when they retire, they are ſucceeded by an infinite number of ſand-flies, which, though ſcarce perceivable to the naked eye, make a great buzzing, and wherever they bite raiſe a ſmall bump in the fleſh, which is ſoon attended with a painful itching, like that ariſing from the bite of an *Engliſh* harveſt bug. This iſland is ſubject to a governor appointed by the king of *Portugal*, and has a garriſon of ſoldiers for its defence.

Hiſtory of Brasil.

This part of *South America* is ſaid to have been firſt diſcovered by *Americus Veſputius*, a *Florentine*, who had the good fortune to be honoured with giving his name to the immenſe continent ſome time before found out by *Columbus*. This was in the year 1498; but he then ſailed no farther than to 5° S. latitude. Afterward, being employed by *Emanuel*, king of *Portugal*, he ſailed again to *Braſil*, and extended his diſcoveries to 52° S. latitude; and the ſame year the king of *Portugal* ſending a fleet to the *Eaſt Indies*, under the admiral *Peter Alvarez Cabral*, he ſtanding out to ſea to avoid the calms upon the coaſt of *Africa*, fell in with the continent of *South America*, and landing in 17° S. latitude, gave the country the name of *Santa Cruz*, which, as we have already ſaid, it ſoon after loſt, and obtained the name of *Braſil*. The admiral ſent one of his ſhips back to *Portugal* with an account of this diſcovery, the richneſs of the country, and its agreeable ſituation; and with the reſt continued his voyage to *India*. The king, pleaſed with the account, reſolved to ſend a colony thither, and the firſt ſettlement was accordingly made; but in a very improper manner, for it was only by baniſhing thither a number of criminals of all kinds. This introduced depraved manners, and rendered the ſettlement of the country extremely difficult, from the diſorders which were introduced, and the animoſity which was excited in the natives. This ſettlement likewiſe met with ſome interruption from the court of *Spain*, who conſidered the country as a part of its dominions. However, the affair was at length accommodated by a treaty, in which it was agreed, that the *Portugueſe* ſhould poſſeſs all the country lying between the river of the Amazons and the river of Plate.

Their right being thus confirmed, the *Portugueſe* purſued the ſettlement with great vigour: conſiderable grants were made to thoſe who were inclined to become adventurers; and many of the nobility of *Portugal* procured an intereſt in a country that promiſed ſuch great advantages. The natives were in moſt parts ſubdued, and the improvement of the colony advanced apace. In a little time the crown became attentive to ſo valuable an acquiſition; the government was new modelled, many exorbitant grants recalled, and every thing ſettled on ſo advantageous a footing, that all the ſea-coaſts for upward of two thouſand miles were in ſome meaſure ſettled to the great benefit of the mother country. The *Portugueſe* conqueſts on the coaſt of *Africa* greatly forwarded this ſettlement, by the number of negroes it afforded the ſettlers for their works; and this was the firſt introduction of *African* ſlavery into *America*.

But in the very meridian of the proſperity of the *Portugueſe*, when they were in poſſeſſion of a moſt extenſive empire, and a flouriſhing trade in *Africa*, *Arabia*, *India*, the iſlands of *Aſia*, and one of the moſt valuable parts of *America*, they received a blow which at once decided the fate of the kingdom. *Sebaſtian*, one of their greateſt princes, loſt his life in an expedition againſt the *Moors*, and by that event the *Portugueſe* loſt their liberty, *Portugal* being very ſoon after abſorbed in the *Spaniſh* dominions.

Soon after the ſame yoke which galled the necks of the *Portugueſe*, becoming inſupportable to the inhabitants of the *Netherlands*, ſeven provinces ſhook it off; and not ſatisfied with forming themſelves into an independent ſtate, and ſupporting their independency by a ſucceſsful defenſive war, with amazing ardour purſued the *Spaniards* into the remoteſt receſſes of their extenſive territories, and grew rich, powerful, and terrible by the ſpoils of their former maſters; they particularly attacked the poſſeſſions of the *Portugueſe*, took almoſt all their fortreſſes in the *Eaſt Indies*, and then turned their arms upon *Braſil*, which being unprotected by the *Spaniards*, and betrayed by the cowardice of the governor of the principal city, they would have conquered the whole country, had not *Don Michael de Texeira* the archbiſhop, who was deſcended from one of the nobleſt families in *Portugal*, taken arms, and at the head of the monks, and a few ſcattered troops, put a ſtop to the conqueſts of the *Dutch*, making a gallant ſtand till ſuccours arrived; and then he reſigned the commiſſion, with which the public neceſſity and his own courage had armed him, into the hands of a perſon appointed by authority. By this ſtand he ſaved ſeven of the captainſhips out of fourteen into which *Braſil* had been divided, the reſt falling into the hands of the *Dutch*, who conquered and kept them with the utmoſt bravery and conduct.

To the brave count *Maurice* of *Naſſau* the *Dutch* owed ſeveral of thoſe conqueſts, the eſtabliſhment of their colonies in *Braſil*, and the advantageous peace by which they were ſecured to them. But as it is natural for a mercantile people to be deſirous of ſudden profit, and as this colony was not under the immediate government of the ſtates, but ſubject to the *Dutch Weſt India* company, they, from principles narrowed by avarice and mean ſentiments, could not bear that the preſent profits of the colony ſhould be ſacrificed to its future ſecurity. The prince kept up more troops and erected more fortreſſes than they were willing to allow him, and therefore treated him in ſuch a manner as obliged him to reſign.

The ſchemes of the company now took place; ſeveral perſons were ſent over who were to have the management of the colony, and who by their parſimony were to reimburſe the company the ſums the colony had coſt. The chief of the illuſtrious perſons who were the ſucceſſors of the great count *Maurice* of *Naſſau*, one of the ableſt, braveſt, and moſt worthy men of that family, ſo famous for producing heroes, were Mr. *Hamel*, a merchant of *Amſterdam*; Mr. *de Baſſis*, a goldſmith of *Harlem*; and Mr. *Bulleſtraet*, a carpenter of *Middleburgh*; all men of good ſenſe and great fidelity to the company: but unfortunately for the republic, as well as their maſters, they underſtood trade better than the art of government. They ſent over to *Holland* the produce of thoſe lands which count *Maurice* had aſſigned for maintaining the fortifications, which in the mean time ran to ruin. They gave licences upon very eaſy terms to the ſoldiers to return home, which leſſened the expence of the army. The charge of a court was retrenched, the debts of the company exacted with the utmoſt rigour and ſeverity, their gains now increaſed cent. per cent. and in their opinion every thing was in a moſt flouriſhing ſtate. But in a ſhort time all theſe fine appearances ended in the total loſs of the country, and the entire ruin of the *Weſt India* company. The hearts of the ſubjects were loſt by their penurious way of dealing, the ſeverity of their proceedings, and their rigorous exactions; thoſe of the *Portugueſe* who had been long ſettled in the country, and had ſubmitted to the *Dutch* government, were now treated with very little ceremony: they therefore purchaſed fire-arms and ammunition of the government, and as they paid a very high price, they obtained whatever they wanted; they then joined the *Portugueſe* who came from *Europe* to their aſſiſtance; by degrees they recovered all the towns the *Hollanders* were in poſſeſſion of, and in 1654 drove them entirely out of the country; ſince which time it has continued in the poſſeſſion of the crown of *Portugal*.

AMAZONIA.

TO the W. of *Braſil* is a country of very great extent, but very little known, which bears the name of AMAZONIA. It may be ſaid to extend from 4° N. to 17° S. and from 50° to 70° W. longitude, from *Greenwich*. Many fabulous ſtories have been related of this country being inhabited by a race of warlike women, who were governed by a queen, ſimilar to the ancient ſtories of ſuch a nation inhabiting a diſtrict of country on the borders of the *Black-ſea*. It has been aſſerted that this female community entirely exclude men from their ſociety, and that ſucceſſive generations are obtained by occaſional commerce with neighbouring nations, and that the female children procured by ſuch embraces are bred up by the mothers, but that the males are ſent to their fathers. The *Spaniards* when they firſt invaded the country, received theſe romantic fictions from ſome *Indians*, who repreſented theſe heroines as extremely expert, brave, and formidable in war, and having themſelves met with ſome women on the confines of *Amazonia*, who were remarkably intrepid and daring, as well as ſkilful in the uſe of weapons of war, the relation was tranſmitted until it became received as a fact; however, its falſehood is now apparent, for *M. de Condamine*, who travelled into theſe parts, made the fulleſt reſearches into this relation, and obtained the moſt ſatiſfactory proofs that it had no foundation in truth.

SECT. V.

GUIANA, *including* SURINAM. *The* DUTCH *Settlements there.*

THE country ſtyled *Guiana*, which includes *Surinam*, extends from 55° to 63° W. longitude from *Greenwich*, and from 1° 15′ to 8° 20′ N. latitude. The great river *Oronooko*, which ſeparates this country from *Paria*, in *Terra Firma*, is its boundary on the N. W. From the mouth of this river the coaſt bends to the S. E. for more than four hundred miles, being waſhed by the *Atlantic ocean*; to the E. it is bounded by *Cayenne*, or *Equinoctial France*, already deſcribed; to the S. by *Amazonia*; on the W. its boundary is uncertain.

Some parts of *Guiana* are poſſeſſed by the *Spaniards*, and ſome by the *French*, but the greateſt extent of country, and the only part which is cultivated to any advantage, is in the hands of the *Dutch*, whoſe firſt ſettlement bears the name of *Surinam*. It was originally ſettled by the *French*, in the year 1640, but ſoon abandoned; the *Engliſh* then took poſſeſſion of it, but they were driven out by the *Dutch*, in the year 1667, to whom it was afterward confirmed by treaty. The river *Suramaca* runs a courſe of about an hundred and fifty miles from S. to N. On its banks the firſt ſettlements were made, which are now increaſed to numerous plantations, the neatneſs, and beautiful ſimplicity of which are ſaid to ſurpaſs the moſt flouriſhing colonies of any other *European* nation. The *Abbé Raynal* (*Hiſtorie Politique, liv.* xii.) makes the number of black inhabitants, in the year 1762, to have been 84,500; the white people conſiſt of emigrants from various parts of *Europe*, or the deſcendants of ſuch, whoſe religions are as various as their origin. Great numbers of *Jews* reſide here, who are all admitted to every privilege of citizenſhip. PARAMABERO, the principal town of *Surinam*, lies on the coaſt, eaſtward of the mouth of the *Suramaca*; it has a large and ſecure harbour. *Raynal* ſtates, that the colony of *Surinam*, in the year 1768, produced one hundred thouſand weight of *cotton*, two hundred thouſand of *cocoa*, fourteen millions of *coffee*, and twenty-eight millions ſix hundred thouſand of raw *ſugar*, and that in the courſe of the ſame year ſeventy ſhips ſailed from its port for *Europe*, freighted with the productions of the country.

The natural hiſtory of *Surinam* has been given in a ſeries of very admirable drawings, which are coloured from nature, by the incomparable pencil of *Madame Myrian*; theſe were purchaſed by Sir *Hans Sloane*, and are now depoſited in the *Britiſh Muſeum*: a full, authentic, and intereſting account of this country, written by an *Engliſh* gentleman, who reſided there ſeveral years, and who has illuſtrated his ſubject with a great variety of drawings, will, in a ſhort time, be laid before the public.

The river *Berbice* is to the weſtward of the *Suramaca*: it likewiſe runs from S. to N. On its banks plantations have been making for fifty years paſt, and more recently other ſettlements have been made to the weſtward, on the *Demerary* and *Iſſequibo*; which two latter ſettlements were taken by the *Engliſh* in the year 1781, but *Demerary* the year after fell into the hands of the *French*, and both reverted to the *Dutch* at the general peace.

The produce obtained from theſe ſettlements is *cotton*, *coffee*, *cocoa*, *ſugar*, and *indico*. At the time of their capture, they were repreſented as annually producing ten thouſand hogſheads of ſugar, five millions pounds weight of coffee, eight hundred thouſand pounds weight of cotton, with a great quantity of cocoa and indico.

We have already ſpoken of two of the vaſt rivers of *South America*; the *Oronooko*, which forms one boundary for *Guiana*, remains to be deſcribed. It is ſaid to be 755 leagues in length, from its ſource, in *Popayan*, near the *Pacific ocean*, to its diſcharge into the *Atlantic*, in 9° N. latitude; where its impetuoſity is ſo great, that it ſtems the moſt powerful tides, and preſerves the freſhneſs of its waters to the diſtance of twelve leagues out at ſea. The *Oronooko*, in the month of *April*, begins to ſwell, and continues to riſe during five months; the ſixth, it remains at its greateſt height; in *October* it begins to ſubſide, and falls gradually until the month of *March*; during which month it remains at a fixed ſtate of its utmoſt diminution. This regular riſe and fall of its waters is unqueſtionably produced by the rainy and the dry ſeaſons which alternately prevail in this part of the world. The ſtupendous rivers of *South America* have not eſcaped the poet's eye, and are finely deſcribed by a *Britiſh* bard.

> Nor leſs thy world *Columbus*, drinks, refreſh'd,
> The laviſh moiſture of the melting year.
> Wide o'er his iſles, the branching *Oronoque*
> Rolls a brown deluge; and the native drives
> To dwell aloft on life ſufficing trees,
> At once his dome, his robe, his food, and arms.
> Swell'd by a thouſand ſtreams, impetuous hurl'd
> From all the roaring *Andes*, huge deſcends
> The mighty *Orellana**. Scarce the muſe
> Dares ſtretch her wing o'er this enormous maſs
> Of ruſhing water; ſcarce ſhe dares attempt
> The ſea like *Plata*; to whoſe dread expanſe,
> Continuous depth, and wondrous length of courſe,
> Our floods are rills. With unabated force,
> In ſilent dignity they ſweep along,
> And traverſe realms unknown, and blooming wilds,
> And fruitful deſerts, worlds of ſolitude,
> Where the ſun ſmiles and ſeaſons teem in vain,
> Unſeen, and unenjoy'd. Forkſaking theſe,
> O'er peopled plains they fair-diffuſive flow,
> And many a nation feed, and circle ſafe,
> In their ſoft boſom, many a happy iſle;
> The ſeat of blamleſs *Pan*, yet undiſturb'd
> By chriſtian crimes and Europe's cruel ſons.
> Thus pouring on they proudly ſeek the deep,
> Whoſe vanquiſhed tide, recoiling from the ſhock,
> Yields to this liquid weight of half the globe;
> And Ocean trembles for his green domain.
>
> THOMSON.

---

* The river of the *Amazons*.

PATAGONIA.

THIS country is bounded on the N. by *Chili* and the government of *Buenos Ayres*; on the E. and W. by the *Atlantic* and the *Pacific oceans*, and on the S. by the *Straits of Magellan*; the continent gradually leſſening till it comes to thoſe ſtraits. It extends from 47° 20′ to 53° 40′ S. latitude, and from 67° 40′ to 78° W. longitude, from *Greenwich*.

Though the *Spaniards* claim the whole country as far as the *Straits of Magellan*, yet the ſouthernmoſt part of it is unpoſſeſſed by them. It is remarkable for a peculiarity, not to be paralleled in any other part of the known world; for though the whole territory N. of the river *Plata* is full of wood, and ſtored with immenſe quantities of large timber-trees, yet S. of the river no trees of any kind are to be met with, except a few peach-trees, which were firſt planted by the *Spaniards* in the neighbourhood of *Buenos Ayres*; ſo that on the whole eaſtern coaſt of *Patagonia*, extending an hundred and ſeventy leagues in length, and reaching as far back as three degrees of longitude on the coaſt in the *Straits*, no other wood has been found than a few inconſiderable ſhrubs.

The continent of *South America* is terminated by a point of land, the extremity of which is called *Cape Froward*, and lies in 53° 40′ S. latitude, longitude 73° 40′ W. from *Greenwich*. For thirty leagues to the eaſtward of *Cape Froward*, the country begins to be woody, and ſo continues to an equal diſtance weſtward of the *Cape*. Trees grow here, of which the beſt maſts imaginable might be made. Commodore *Byron* deſcribes them as of great height, and more than eight feet in diameter, ſo that four men joining hand in hand could not compaſs them. Eaſtward of the extreme point of the continent of *South America* is a cape, which riſes upward of one hundred and fifty feet above the level of the ſea, and conſiſts entirely of horizontal ſtrata of petrified ſhells. M. *de Bougainville* ſays, he went in a boat to take the ſoundings at the foot of this monument which marks the great changes our globe has undergone, and was unable to reach the bottom with a line of a hundred fathom. The ſoil in this part of *Patagonia* appears to be very good; the country is watered with no leſs than three rivers, beſide brooks. The hills are of an immenſe height. The maſter of the *Swallow*, captain *Carteret*'s ſhip, in 1767, climbed one of the higheſt mountains near *Cape Gallant*, which lies to the weſtward of *Cape Froward*, hoping from its ſummit to obtain a ſight of the *South Sea*; but he found his view intercepted by mountains ſtill higher, on the ſouthern ſhore. Here he erected a pyramid, within which he depoſited a bottle containing a ſhilling, and a paper, on which was written the ſhip's name, and the date of the year. A memorial which may poſſibly remain there as long as the world endures. Here captain *Wallis* cauſed ſome thouſand young trees to be taken up by the roots, with a proper quantity of earth, and packing them, ſent them to *Falkland*'s *Iſlands*, in hopes thereby of ſupplying that ſpot with timber: how the attempt has ſucceeded, we have not been able to learn. Near *Cape Froward* were ſeen a great number of currant-buſhes full of fruit, but none of it ripe, about the middle of *January*. A great variety of beautiful ſhrubs were ſeen at the ſame time in full bloſſom, beſide great plenty of winter's bark. Notwithſtanding this appearance of nature, M. *de Bougainville* informs us, that *Reaumur*'s thermometer only roſe one day ten degrees above the freezing point whilſt he was on the coaſt of *Patagonia*, although it was the middle of ſummer, and the ſun was eighteen hours above the horizon; it was frequently as low as ſeven degrees. About three miles up a river, near *Cape Gallant*, is a remarkable cataract, which guſhes from between two mountains of a ſtupendous height. This water-fall is precipitated from an elevation of above four hundred yards; half the way it rolls over a very ſteep declivity, and the other half is a perpendicular fall. The ſound of this cataract is no leſs awful than the ſight.

At *Port Famine*, which lies a little to the E. of *Cape Froward*, the *Spaniards* built a town in 1581, which they called *Philippeville*; and here they placed a colony, conſiſting of four hundred perſons. That renowned *Engliſh* navigator, *Cavendiſh*, arrived here in 1587, and found only one of theſe ſettlers alive upon the beach; twenty-three of them had ſet out for the river of *Plate*, and were never heard of afterward; all the reſt had miſerably periſhed by famine. The ſurviving *Spaniard* was brought to *England* by *Cavendiſh*. From this cataſtrophe the place received the name of *Port Famine*.

The footſteps of many wild beaſts were tracked in the ſand, but ſcarcely any ſeen; alſo many huts or wigwams were ſeen, but no *Indians*. Theſe wigwams are built of young trees, which are ſharpened at one end, and thruſt into the ground in a circular form; the other ends are then brought to meet, and faſtened together at the top.

Here was ſeen an animal reſembling an aſs, but having a cloven foot, as was diſcovered by tracking it. It was as ſwift as a deer. The *French* killed a fox, which reſembled thoſe of *Europe*. In the woods are innumerable parrots, and other birds of beautiful plumage, notwithſtanding the coldneſs of the climate. The ſea and rivers abound with fiſh.

The eaſtern coaſt of *Patagonia*, on the entrance of the *Magellanic Straits*, ſeems to be moſt inhabited. This race of men have been variouſly repreſented by different veyagers with reſpect to their ſtature. Such as made early viſits to this country are not agreed in this particular, and among recent voyagers there is the ſame contrariety of ſentiment. Commodore *Byron*, who viſited this coaſt in December 1764, ſays, one of theſe people, who appeared to be a chief, came toward him; he was of a gigantic ſtature, and ſeemed to realize the tales of monſters in a human ſhape: he had the ſkin of ſome wild beaſt thrown over his ſhoulders, as a *Scotch Highlander* wears his plaid, and was painted, ſo as to make the moſt hideous appearance ever beheld: round one eye was a large circle of white, a circle of black ſurrounded the other, and the reſt of his face was ſtreaked with paint of different colours. He adds, "I did not meaſure him, but if I may judge of his height by the proportion of his ſtature to my own, it could not be much leſs than ſeven feet. There were among them many women who ſeemed to be proportionably large; and few of the men were leſs than the chief who had come forward to meet me." In confirmation of this account, Capt. *Carteret*, in a letter to Dr. *Maty*, which is publiſhed in Vol. LX. of the *Philoſophical Tranſactions*, ſays, that he meaſured many of them, and found them in general from ſix feet, to ſix feet five inches in height. On the other hand, M. *de Bougainville*, who touched here in 1765, and again in 1767, ſays, "Among thoſe whom we ſaw, none was below five feet ten inches, and none above ſix feet *Engliſh* meaſure. What makes them appear gigantic, are their prodigious broad ſhoulders, the ſize of their heads and the thickneſs of all their limbs. They are robuſt, and well fed: their nerves are braced, and their muſcles are ſtrong and ſufficiently hard; they are men left entirely to nature, and ſupplied with food abounding with nutritive juices, by which means they arrive at the full growth they are capable of." The ſame writer obſerves elſewhere, that the inhabitants of *Otaheite* are taller than the *Patagonians*.

Their colour is bronzed, as it is in all the *Americans* without exception; both in thoſe who inhabit the torrid zone, and thoſe who are born in the temperate and frigid ones. None among them ſeemed, by the *French* account which is given of them, to have any apparent ſuperiority over the reſt, nor did they ſhew any kind of eſteem for two or three old men who were in their troop. They were all painted, and clothed nearly in the ſame manner; the circles round the two eyes were in no inſtance of one colour, but they were not univerſally black and white, ſome being white and red, and ſome red and black: their teeth were as white as ivory, remarkably even and well ſet; they had no other clothing than ſkins, which they wore with the hair inward, and a piece of leather covered their private parts. Some indeed wore upon their legs a kind of boot, with a ſhort-pointed ſtick faſtened to each heel, which ſerved as a ſpur. Not the leaſt appearance of ferocity was diſcoverable in theſe people. *Bougainville*, who is the only one who ſpeaks of their language, ſays, it ſeemed to be very delicate. They aſked him by ſigns for tobacco, and appeared fond of any thing red. Captain *Wallis*, who touched here in 1767, ſaw about four hundred *Patagonians* encamped in a fine green valley between two hills, with their horſes feeding beſide them. They cried, as they had been taught by commodore *Byron*, "*Engliſhmen*, come aſhore;" but could by no means be made to underſtand, that ſome guanacoes and oſtriches would be very acceptable preſents.

The women ride aſtride, and both men and women, without ſtirrups; yet they galloped fearleſsly over the beach, though the ſtones there were large, looſe, and ſlippery. Their horſes are little, and very lean: they are bridled and ſaddled in the ſame manner as thoſe belonging to the inhabitants of *Rio de la Plata*. They appeared to be nimble and well broken; the bridle was a leathern thong, with a ſmall piece of wood, that ſerved for a bit, and the ſaddſes reſembled the pads that are in uſe among the country people in *England*. They had with them little naſty dogs, with which they are ſuppoſed to chaſe wild animals: theſe, like their horſes, drank ſea-water, it being a very ſcarce thing to get freſh water on this coaſt. The chief food of theſe people ſeemed to be the fleſh of the guanacoes, and ſome other animals. Many of the natives were ſeen to have quarters of this fleſh faſtened on their horſes, pieces of which they ate quite raw.

By the 6th article of the convention between the king of *Great Britain* and the king of *Spain*, ſigned at the *Eſcurial*, on the 28th of October 1790, it is agreed, that "No ſettlement ſhall be formed on the eaſtern or weſtern coaſt of *South America*, in ſuch parts of thoſe coaſts as are ſouthward, and of thoſe already occupied by *Spain*;" but the ſubjects of each power have the liberty of landing on the coaſts and iſlands, for the purpoſe of carrying on fiſheries, and may erect huts, and ſuch temporary buildings.—Had the preciſe degree of latitude been laid down, beyond which, to the ſouthward, no ſettlement ſhould in future be made, the ſtipulation might have been more explicit, but it appears expreſsly to inhibit any ſettlement, by either power, being made in any part of the coaſt of *Patagonia*.

SECT. V.

The FALKLAND ISLANDS, *the iſlands of* TERRA DEL FUEGO, *and* STATEN LAND. *The regulations eſtabliſhed by the Convention with* SPAIN, *and the* WHALE FISHERY *carried on in thoſe parts.*

FALKLAND *Iſlands* are ſituated to the N. E. of the *Straits of Magellan*, in 51° 22′ S. latitude, and from 63° 15′ to 65° 45′ W. longitude, from *Greenwich*; extending about 40 miles in breadth from N. to S. and 95 miles in length from E. to W.; being only divided by a ſtrait, in ſome places four, and in others five or ſix miles in breadth. The above ſtrait, and the greateſt part of the coaſt, are formed into a number of bays and creeks. As theſe iſlands are in the ſame latitude as the S. of *England*, they might be ſuppoſed to enjoy nearly the ſame climate, if it was not well known that the ſouthern hemiſphere is much more inclement than the northern. The length of the days throughout the year is the ſame here as in *England*, but the ſeaſons are directly oppoſite. Both iſlands are dreary and deſolate ſpots, furniſhing neither timber nor underwood. The coaſts are frequented by innumerable herds of ſeals, and vaſt flights of wild geeſe repair here to lay their eggs; penguins and albatoſſes alſo abound, and the ſea is well ſtored with delicious fiſh.

The *Falkland Iſlands* were firſt diſcovered by Sir *Richard Hawkins* in 1594, who called them *Maidenland*, in honour of queen *Elizabeth*; and captain *John Strong* of the *Farewell*, from *London*, ſailed through the *Sound* in 1689, to which he gave the name of *Falkland Sound*. Sir *John Narborough* and captain *Woodes Rogers*, at different times, viſited this ſpot, one in the reign of *Charles* II. the other in that of king *William*. The importance of theſe iſlands was ſtrongly enforced by the ingenious author of *Anſon*'s *Voyage round the World*. A ſettlement was accordingly made here, ſoon after captain *Cook* had completed his firſt voyage round the world; which, in the year 1770, the *Spaniards* wreſted from the *Engliſh*, but on remonſtrances being made by the *Britiſh* miniſter at the court of *Madrid*, the iſlands were reſtored, after the nation had incurred three millions of expence by preparing for war. What renders theſe iſlands important in the eye of government, is, that they are eſſentially neceſſary for carrying on a whale-fiſhery, which, for ſixteen years paſt (from 1791), has been very rapidly riſing into importance, and now carried on to an aſtoniſhing extent.

THE iſlands that lie to the S. of the *Straits of Magellan*, are commonly known by the name of TERRA DEL FUEGO, and are thus called from the fires and ſmoke perceived by the firſt diſcoverers of them, occaſioned by a volcano in the largeſt iſland; the flame of which, though not ſeen in the day-time, is viſible at a vaſt diſtance in the night, and ſometimes throws up great quantities of ſtones and aſhes. Theſe iſlands, the far largeſt of which is that properly called *Terra del Fuego*, extend along the *Magellanic* coaſt from E. to W. about four hundred miles, and were thought contiguous to the continent, till *Megellan* diſcovered and ſailed through the ſtraits that part them from it.

This country is in general very mountainous and rough, with the tops of the mountains covered with ſnow. It is ſuppoſed to be interſected by branches of the ſea which open a communication between the *Straits of Magellan* and the ocean, near *Cape Horn*. About the middle of theſe ſtraits M. *de Bougainville* is of opinion that there is ſuch a channel, which he founds on having croſſed a great inlet, the entrance of which is about two leagues wide, but no termination of it could be ſeen; a great number of whales where ſporting there, and the ſea had a great ſwell.

M. *de Bougainville* gives the name of *Pecherais* to the ſavages who inhabit *Terra del Fuego*, becauſe that was the firſt word which they pronounced on approaching his ſhips, and afterward repeated inceſſantly, as the *Patagonians* did their *Shawa*. "Of all the ſavages I ever ſaw," ſays that judicious voyager, "the *Pecherais* are thoſe who are moſt deprived of every convenience; they are exactly, in what may be called, a ſtate of nature; and indeed, if any pity is due to the fate of a man who is his own maſter, has no duties or buſineſs to attend, is content with what he has, becauſe he knows no better, I ſhould pity theſe men, who, beſide being deprived of what renders life convenient, muſt ſuffer the extreme roughneſs of the moſt dreadful climate in the world. The *Pecherais* likewiſe are the leaſt numerous ſociety of men I have met with in any part of the world."

Theſe ſavages are ſhort, ugly, meagre, and carry an inſupportable ſtench about with them. They are almoſt naked, having no other dreſs than wretched ſeal-ſkins, too little for them to wrap themſelves in: theſe ſkins ſerve them equally as roofs to their huts, and as ſails to their periaguas. They have likewiſe ſome guanaco-ſkins, but they are in ſmall number. Their women are hideous, and ſeemed little regarded by the men. They are obliged to ſteer their periaguas, and to keep them in repair; often ſwimming to them, notwithſtanding the cold, through the ſea-weeds, which ſerve as a harbour to theſe boats. On ſhore they gather wood and ſhells, without the men partaking in their labours; nor are thoſe women who have children at their breaſts exempted from ſuch employments. They carry their children on their backs, folded in the ſkins which ſerve them as dreſſes.

Their boats, or periaguas, are made of bark, ill connected with ruſhes, and caulked with moſs in the ſeams. In the middle of each is a little hearth of ſand, where they always keep up ſome fire. Their arms are bows and arrows made of the wood of a holly-leaved berberry-buſh, which is common in the ſtraits; the bowſtring is made of a gut, and the arrows are armed with points of ſtone, cut with tolerable ſkill; but theſe weapons are made uſe of, rather againſt game than againſt enemies; for they are, ſays the *French* writer above quoted, as weak as the arms which are deſtined to manage them. Some bones of fiſh were ſeen among them, which were about a foot long, ſharp at the end, and toothed along one ſide. This was conjectured to be uſed in fiſhing; they fix it on a long pole, and uſe it as an harpoon. Men, women, and children, live promiſcuouſly in their huts, in the middle of which they light a fire. They ſubſiſt principally on ſhell-fiſh. Theſe *Indians* have dogs as well as the *Patagonians*, and have nooſes or ſpringes made of whalebone. All who were ſeen had bad teeth, occaſioned, as was ſuppoſed, by their cuſtom of eating the ſhell-fiſh boiling hot, although half raw.

A child about twelve years of age, who had received ſeveral bits of glaſs from ſome of the ſailors on board M. *de Bougainville*'s ſhip the *Etoile*, was ſuddenly ſeized with ſpitting of blood and violent convulſions. He had taken ſome of the glaſs into his mouth, had ground it to pieces with his teeth, and in part ſwallowed it; in conſequence of which his lips, gums, and palate, were cut in ſeveral places, and he bled continually. This accident excited ſuſpicions in the *Pecherais* againſt their new acquaintance, which they had not before entertained. One of their jugglers undertook the recovery of the boy, but previous to the performance of thoſe incantations, which are ſuppoſed to operate for the reſtoration of the ſick, he ſtripped his patient of a linen jacket which had been given him, which he returned to the *French*; whence it was conjectured, that the doctor apprehended a baneful effect had been produced by that cloathing. He then laid his patient in one of the huts upon his back, and kneeling down between his legs, bent himſelf upon him, and with his hands and head preſſed the child's belly with great force; crying out continually, without uttering any articulate ſounds. From time to time he got up, and ſeeming to hold the diſeaſe in his joined hands, he opened them all at once into the air, blowing as if he wanted to drive away ſome evil ſpirit. During this ceremony an old woman in tears howled in the ears of the ſick child loud enough to deafen him; ſo that the poor wretch ſeemed to ſuffer equally from the means uſed for his recovery, as from the hurt which he had received. Theſe means proving ineffectual, the juggler went to fetch his habit of ceremony; when having his hair powdered, and his head adorned with two white wings, like thoſe on *Mercury*'s cap, he began his rites again, which were however attended with no better ſucceſs; for the child appeared to grow worſe, and the chaplain, ſolicitous about the ſtate of his ſoul, adminiſtered baptiſm to him by *ſtealth*. The ſurgeon of the ſhip then brought ſome milk and gruel to him. The grief of the parents, their tears, the part which the whole troop took in this accident, and which broke out in the moſt expreſſive ſigns, exhibited a truly affecting ſcene. The ſavages perceiving how much the ſtrangers partook of their diſtreſs, evidently grew leſs ſuſpicious of them: they allowed the ſurgeon to examine the boy's bloody mouth, which the father and other *Pecherais* ſucked alternately. It was difficult to prevail on them to uſe milk, and the company were obliged to taſte it before them ſeveral times: afterward the patient drank ſome gruel. The jugglers were jealous of the ſurgeon, whom however they at length began to acknowledge as an able juggler. The *French* returned on board the ſhip at night, and about two o'clock in the morning they heard repeated howls uttered by the ſavages on ſhore; and at break of day, though the weather was very dreadful, the ſavages went off. Doubtleſs flying from a place defiled by death, and by unlucky ſtrangers, who they thought were come merely to deſtroy them.

We are told by M. *de Bougainville*, that the *Spaniards* at *Buenos Ayres*, in return for the kindneſſes which the inhabitants of *Terra del Fuego* ſhewed to the crew of the ſhip *la Conception*, which was wrecked on their coaſt in 1765, have ſent miſſionaries among theſe ſavage *Indians*.——The firſt inſtance of a miſſion to an inhoſpitable climate, and where a beneficial commerce could not be carried on!

It appears from the accounts which modern voyagers have given of theſe parts, that the *Straits of Magellan* are above a hundred leagues in length, from the cape of the *Virgins* at the eaſtern entrance, to *Cape Deſire* at the weſtern end. The breadth is very various, it being in ſome narrows but a league wide, and in more open parts five and ſeven leagues over; there are many ſafe harbours running into the continent, with narrow entrances and bays that extend quite out of ſight, encompaſſed with high mountains which ſhelter them on all ſides; ſo that ſhips may ſafely ride in them at ſingle anchor in any weather.

On the S. E. ſide of the iſlands which form this ſtrait is STATEN LAND, in about 55° S. latitude, and between it and *Terra del Fuego* runs *Strait le Maire*, which is about ſeven or eight leagues in length. "I cannot but remark," ſays the author of *Lord Anſon's Voyage*, "that though *Terra del Fuego* had an aſpect extremely barren, yet this iſland of *Staten Land* far ſurpaſſes it in the wildneſs and horror of its appearance; it ſeeming to be entirely compoſed of inacceſſible rocks, without the leaſt mixture of earth or mould between them. Theſe rocks terminate in a vaſt number of ragged points, which ſpire up to a prodigious height, and are all of them covered with everlaſting ſnow; the points themſelves are on every ſide ſurrounded with frightful precipices, and often over-hang in a moſt aſtoniſhing manner; and the hills on which they reſt are generally ſeparated from each other by narrow clifts, which appear as if the country had been frequently rent by earthquakes; for theſe chaſms are nearly perpendicular, and extend through the ſubſtance of the main rocks, almoſt to their very bottoms: ſo that nothing can be imagined more ſavage and gloomy than the whole aſpect of this coaſt."

The paſſage into the *South Sea*, or *Pacific ocean*, is now generally performed by running through *Strait le Maire*, by theſe inhoſpitable iſlands, and then doubling *Cape Horn*, the moſt ſouthern promontory of *Terra del Fuego*; notwithſtanding, many navigators have choſen to paſs the *Magellanic Straits*; among theſe are commodore *Byron*, captains *Wallis* and *Cartaret*, likewiſe the celebrated *French* navigator, Monſ. *de Bougainville*; captain *Cook* preferred doubling *Cape Horn*.

A more ſtriking inſtance cannot be given of the inclemency even of the ſummers in theſe regions, than by relating the imminent danger to which Mr. (now Sir *Joſeph*) *Banks*, Dr. *Solander*, and their company, were expoſed on the coaſt of *Terra del Fuego*, near *Strait le Maire*, in January 1768. It was then the height of the ſummer-ſeaſon, anſwering to the middle of our July. Mr. *Banks* and Dr. *Solander* were deſirous of availing themſelves of a fine day, which, in that climate, is very rare, even at that time of the year, to explore a country which had never been viſited by any botaniſt. For this purpoſe, they went on ſhore early in the morning, being twelve in company. They preſently found great and unexpected impediments in their progreſs, by deep ſwamps and thick underwood, ſo that they were until three o'clock in the afternoon employed in aſcending a mountain; when ſuddenly the air, which had been till then ſerene and mild, became cold and piercing, and ſnow began to fall; notwithſtanding which, they proceeded, in expectation of reaching the rocky part of the hill, which lay before them at a ſmall diſtance. This perſeverance was rewarded by finding a great variety of plants entirely unknown to botaniſts; the day, however, was now ſo far ſpent, that it was impoſſible to return to the ſhip that night; and the cold had by this time become very intenſe, and large quantities of ſnow had fallen, ſo that the moſt dreary proſpect preſented itſelf. Whilſt they were proceeding in ſearch of the neareſt valley, Dr. *Solander*, who was well acquainted with the effects of intenſe cold, having paſſed over the mountains that divide *Sweden* and *Norway*, repreſented to the company, the neceſſity they were under of continuing in motion, however they might feel themſelves attacked by a laſſitude and ſluggiſhneſs; he aſſured them, that whoever ſat down would ſleep, and whoever ſlept would wake no more.

They had not proceeded far before the effects apprehended began to be felt, and he, who had thus cautioned others, was the firſt to declare himſelf unable to obſerve his own precept; at length, overcome by a ſtupor, he threw himſelf on the ground although it was covered with ſnow. A black ſervant of Mr. *Banks*, named *Richmond*, next yielded to this fatal propenſity. In this diſtreſs five of the company were ſent forward to make a fire at the firſt convenient place they could find, whilſt the reſt continued with the doctor, making uſe of every means to keep him awake. The poor negro was ſo overcome with fatigue, that being told he muſt keep in motion or he would be frozen to death, replied that he deſired only to lie down and die. At length all the endeavours of the company became ineffectual; their whole ſtrength was not ſufficient to carry their two exhauſted companions, ſo that they were ſuffered to ſit down, and in a ſhort time they fell into a ſound ſleep. In a few minutes after, news was brought that a fire was kindled at the diſtance of about a quarter of a mile. Dr. *Solander* was then waked with great difficulty, but during his ſhort ſleep his muſcles were become ſo contracted that his ſhoes fell off his feet, and he had almoſt loſt the uſe of his limbs; but all attempts to wake the ſervant were ineffectual: two men, who ſeemed to have ſuffered the leaſt by the cold, were left to look after him, and in a ſhort time two others were ſent to their relief; one of the former rejoined the company, but the other was quite inſenſible; their companions therefore made them a bed of boughs, and ſpread the ſame covering over them to a conſiderable height, and in that ſituation left them.

The company paſſed the remainder of the night in a dreadful ſituation round the fire, ſuppoſing themſelves at a great diſtance from the ſhip, their way laying through a trackleſs wood, and being unprovided with refreſhments, their only proviſions being a vulture, which they had ſhot in their journey. Nor did the dawn of day remove their apprehenſions; for at the approach of light nothing preſented itſelf to their view but a dreary expanſe of ſnow. It was not till ſix o'clock in the morning that they could diſcover the place of the ſun through the clouds which then began ſomewhat to diſperſe. With foreboding apprehenſions they went in ſearch of poor *Richmond* and the other man, whom they found quite dead; a dog, which belonged to one of them, was found alive, ſtanding cloſe by his maſter's corpſe, which he unwillingly left to follow the company. The hardy nature of this animal enabled him to brave the ſeverity of the weather, and he was ſome years ago alive in *England*.

About eight o'clock the ſnow began to melt, and the company determined upon ſetting forward. Their hunger by this time was become outrageous; having therefore ſkinned their vulture, they divided it into ten parts, every man dreſſing his own ſhare for himſelf. This ſcanty meal, which only furniſhed each perſon with a few mouthfuls, being finiſhed, they quitted their fire-ſide about ten o'clock, and, no leſs unexpectedly than joyfully, reached the beach where the ſhip lay in about three hours; for upon tracing their advances toward the hill the day before, they found, that, inſtead of aſcending in a direct line, they had almoſt gone round it. How much is the world indebted to men of ſcience, who will brave all the dangers of the moſt inhoſpitable climes to enlarge the ſtores of human knowledge!

There are ſeveral other iſlands about thoſe juſt mentioned; but they are of little conſequence, none of them being planted by any *European* nation.

The Southern WHALE FISHERY.

Having now completed our ſurvey of the Globe, we cannot conclude ſo important a work in a more intereſting manner than by laying before our readers an account of the riſe and progreſs of the ſouthern whale fiſhery; a branch of commerce which exhibits, in a very ſtrong and advantageous point of view, the enterpriſing ſpirit, the ample wealth, and the judicious plans of *Britiſh* merchants. This we are enabled to do by the obliging communications of a very reſpectable merchant to whom the nation is chiefly indebted for this honourable and highly beneficial branch of commerce, which has ever excited the jealouſy of the *Spaniards*, and hath at length no leſs mortified their pride by the conceſſions which they have been compelled to make in the late convention.

In the year 1775 the firſt ſhips were fitted out for this fiſhery; they were ten in number, carrying 1388 tons. Of theſe ſhips Mr. Enderby owned three, Mr. Hayley two, Champion and Co. two, and Meſſrs. De Berdt and Co. Harriſon and Co. and Harford and Co. ſent out one each. Theſe ſhips brought home 221 tons of Spermaceti-oil, and 127 tons of whale-oil.

1776. Ships.	Tons.	Spermaceti.	Whale-oil.
14	2513	228	518.

The largeſt ſhip employed was of 415 tons burden.

1777. Ships.	Tons.	Spermaceti-oil.	Whale-oil.
15	3327	368	365.

A ſhip likewiſe went from Liverpool this year.

Five premiums now began to be given by government, namely 500l. for the ſhip which obtained the greateſt quantity of oil; 400l. for the next; 300l. 200l. and 100l. for the proportional largeſt quantities of oil in three other ſhips.

1778. 17 ſhips; their burden 2777 tons.

Ten of theſe ſhips were taken this year, two of which were retaken. The oil brought home was 197 tons of whale.

	Ships.	Tons.	Spermaceti.	Whale.
1779	5	740	109.	
1780	9	1359	244.	
1781	No ſhips went out.			
1782	3	559	175.	
1783	4	739	257.	
1784	13	3095	810.	

One ſhip was loſt.

1785. 21 4471 327 337.

Some ſhips then began to fit out for two ſeaſons, and three of the above ſtayed; 18 returned.

1786. 35 7742 481 1389.

Beſide the three remaining the former year.

Theſe ſhips likewiſe brought home whale-bone 922lb. weight. Seal-ſkins 8000.

They all ſailed from the port of *London*; there were likewiſe three ſhips fitted out at *Liverpool*, one at *Briſtol*, and one at *Hull*: their tonnage 859.

29 ſhips returned.

14 remained two ſeaſons.

The total value of the cargoes brought home in the year 1787, including the five out port ſhips, amounted to 57,350l.

This year government extended the premiums as follows. For ſhips that ſhall ſail after the firſt of May, and before the firſt of September, and ſhall return by the firſt of July the year following, with the greateſt quantities 3 premiums of 500l.
3 - 400l.
3 - 300l.
3 - 200l.
3 - 100l.

Alſo five premiums for ſhips which ſhould ſail between the ſame times, and ſhould return within twenty-eight months, and not under eighteen, with the largeſt quantities of oil. 1 premium of 700l.
1 - 600l.
1 - 500l.
1 - 400l.
1 - 300l.

Since this encouragement has been given, the fiſhery has increaſed to a very great extent. Some ſhips have even doubled *Cape Horn*, and procured whales in the South Sea, near the weſtern coaſt of *South America*. Each ſhip is provided with iron pans, generally two in a ſhip, containing about 100 gallons each, in which the fiſh are boiled, and the oil obtained, contrary to the practice of the *Greenland* fiſhery, where the fiſh are brought home, and the oil afterward obtained by boiling in coppers appropriated for that purpoſe.

Voyages on the Southern Whale fiſhery have been completed in ten months, but their uſual time is from twelve to fifteen months. The ſhips employed in this fiſhery are in general copper bottomed.

END OF THE SECOND VOLUME.

Apes on the Gold Coaſt, I. 419. at Sierra Leone, 436.
Appenine ms. II. 395.
Areka nut of Tonquin, I. 146.
Armour Fiſh, I. 31.
Aſafœdita of Perſia, I. 228.
Aſbeſtos, or Amianthus, II. 102.
Aſſazo, a plant of Abyſſinia, ſaid to ſtupify Serpents, I. 328.
Aſſes of India, I. 181. of the Canary is. 460. 462. Wild, II. 743.
Atlas, m. I. 480. 483. 492.
Avalanches, or monſtrous Snow-balls, II. 334.
Aurora Auſtralis, I. 563.
Aurora Borealis, an appearance ſimilar in ſome reſpects to it ſeen by Capt. Cook, I. 559.
Aurora Borealis, the, in Swediſh Lapland, II. 97. In the N. of Scotland, 616.

BABOON, the, of the Cape of Good Hope, I. 359.
Bald-pate fiſh of India, I. 182.
Balſam tree of Carthagena, II. 736.
Bamboo reed of China, I. 29.
Bang, a plant reſembling hemp, I. 126. much uſed at Surat, 217.
Banian tree, I. 180.
Barley, produced at Japan, I. 10.
Baſaltine columns in the Venetian State, II. 349. on the i: of Staffa, 623. in Ireland, called the Giant's Cauſeway, 635, 636.
Baths, at Ribar, II. 131. at Buda, 132. Baden, 151. 318. Glatz, 169. Aix la Chapelle, 259. Peeffers, 317. Leuck, 327. Abano, 357 *. Aix in Provence, 453 *. 454 *. at Bath, 535. Briſtol, 535, 536. Buxton, 578. Matlock, 579.
Baths near Potoſi, called Don Diego, II. 752. See Springs, Minerals.
Bats, very large, at Borneo, I. 122. of India, 182. New Zealand, 621. of Carthagena, II. 737.
Bears of Kamtſchatka, I. 79. manner of ſhooting them there, ib. driven to Iceland, on large pieces of floating ice, II. 639. of N. Am^a, 679.
Beaſts of the Pelew is. I. 100.
Beavers, II. 648.
Beccafigo, a bird of Provence, II. 453 *.
Bee's Wax of Egypt, I. 326.
Bees of Ceylon, I. 137. Abyſſinia, 329. Madagaſcar, 348. of Guadaloupe, II. 713. Canary is. 471, 472.
Beetle, a ſingular one at Japan, called Sebi, I. 12.
Benjamin, or Benzoin, II. 126.
Benjoin produced at Laos, I. 151.
Bejucos, the, of Quito, II. 745. Bridge made of its vegetable cordage, 748.
Betel plant, its deſcription and uſe, I. 134.
Bird; of Paradiſe, I. 111. a remarkable bird caught by commodore Byron, ſuppoſed to be a non-deſcript, 526. a black one ſuperſtitiouſly revered at Benin, 404.
Birds, the flight of certain, the direction for travelling over ſome of the deſerts of Africa, I. 457.
Birds of Japan, I. 10. China, 31. The Pelew is. 100. Sumatra, 126. Syria, 282. Abyſſinia, 329. of the Hottentot countries, 360. of Mexico, II. 727. Carthagena, 736.
Black-cap, the, a Bird of Norway, II. 104.
Bole-armoniac, I. 227.
Bonito fiſh, I. 182.
Bononian Stone, found in the Appenine ms. II. 377.
Bouquetin, a ſpecies of Wild Goat, II. 336.
Braſſem, fiſh, at the Cape of Good Hope, I. 363.
Bread-fruit tree deſcribed, I. 95. 622.
Bream, fiſh, I. 478.
Briſtol Stones, II. 544.
Buffaloes, their fierceneſs, but rendered tractable by children, I. 156. of India, 181. Abyſſinia, 329. the Cape of Good Hope, 358.——in lord Tankerville's park, II. 584. of N. Am^a, 658.
Burgamot tree of Barbadoes, II. 707.
Burning Mountains. See Volcanoes.
Butterflies of China, I. 31. a curious ſpecies in Barbary, 482. of Mexico, II. 728.

CACAO tree, II. 736.
Calin, a ſpecies of tin in India, I. 170.
Calms off the Canary is. I. 462.
Camel of China, I. 27. 30. 45. India, 181. Arabia, 260. Syria, 281. its fleſh eaten in Morocco, 487.
Cameleon, the, deſcribed, I. 299. 419.
Camelopardalis, or Giraffe of Abyſſinia, I. 328. of the Cape of Good Hope, particularly deſcribed, 358.
Camphire tree, I. 9.
Canary Birds, I. 463.
Canes of Guayaquil, II. 744, 745.
Capſa Sparrow, the, of Barbary, I. 82.
Capua tree, II. 713.
Caſſia fiſtula of China, I. 28.
Cat, the black-eared, of Barbary, I. 482.
Cataract on the Rhine at Lauffen, II. 315. called Caſcata del Marmore, 385. in Somerſetſhire, 537, 538. in Scotland, 609. on the Shannon, 624.
Cats, very beautiful in Japan, I. 10.
Caterpillars at the Cape of Good Hope, I. 362.

Cattle of Poland, II. 57. of Germany, 138.
